SHELL OIL COMPANY

1700 BROADWAY
DENVER, COLORADO 80202

April 11, 1972

Subject: Shell-Duncan-Tew 1-9B5
2334' FNL & 1201' FEL
Section 9-T2S-R5W
Altamont Field
Duchesne County, Utah

State of Utah
Department of Natural Resources
Division of Oil & Gas Conservation
1588 West North Temple
Salt Lake City, Utah 84116

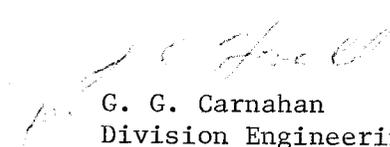

Attention Mr. Cleon B. Feight

Gentlemen:

The attached application for a drilling permit for Shell-Duncan-Tew 1-9B5, Section 9-T2S-R5W, Duchesne County, Utah, specifies a location which does not conform to the order issued in Cause No. 139-4. This location would cause the least disruption of natural drainage and irrigation features while maintaining relative conformity with the established spacing pattern.

Shell Oil Company requests approval of this exception location for topographic reasons under the provision of the above order.

Yours very truly,

G. G. Carnahan
Division Engineering Manager
Rocky Mountain Division

Re: Shell-Duncan-Tew #1-9B5
Sec. 9, T. 2 S, R. 5 W, USM
Duchesne County, Utah

Gentlemen:

Insofar as this office is concerned, approval to drill the above referred to well is hereby granted in accordance with the topographic exception under the Order issued in Cause No. 139-3/139-4.

It should be noted that the following mud system monitoring equipment must be installed (with derrick floor indicators) and used throughout the period of drilling after setting and cementing the surface casing:

- (1) Recording mud pit level indicator to determine mud pit volume gains and losses. This indicator shall include a visual or audio warning device.
- (2) Mud volume measuring device for accurately determining mud volumes required to fill the hole on trips.
- (3) Mud return indicator to determine that returns essentially equal the pump discharge rate.

Enclosed please find Form OGC-8-X, which is to be completed whether or not water sands (aquifers) are encountered during drilling. Your cooperation with regard to completing this form will be greatly appreciated.

15,400' Wasatch Test
5" liner @ 15,270'

TD 15,337. PB 15,150.

9/30: Prep to perf. Press tested tbg to 7500 psi for 1 hr, OK. Installed BP valve, removed BOP, installed 10,000# Xmas tree, removed BP valve, and installed test plug. Tested tree to 10,500 psi, OK. Removed test plug. Released rig @ 1 PM. RU Archer-Reed. Knocked out tbg plug. Lost tools in hole. Released Archer-Reed. Tbg design as follows: Baker Model "C" plug holder @ 11,010', seal assembly @ 11,000', Baker Model "EL" on-off tool @ 10,995', 4' x 2-7/8" EUE tbg sub w/cent, 5 jts 2-7/8" EUE 8rd tbg, Merla KBM mandrel test #9-110 @ 10,831', 11 jts tbg, KBM mandrel test #9-107 @ 10,486', 15 jts tbg, KBM mandrel test #9-106 @ 10,019', 23 jts tbg, KBM mandrel test #9-105 @ 9306', 31 jts tbg, KBM mandrel test #9-104 @ 8346', 44 jts tbg, KBM mandrel test #9-103 @ 6986', 59 jts tbg, KBM mandrel test #9-101 @ 5164', 76 jts tbg, KBM mandrel test #9-100 @ 2819', 90 jts tbg, 10' sub and 1 jt tbg (total of 355 jts 2-7/8" N-80 EUE 8rd tbg, 8 KBM Merla mandrels, one 4' sub, one 10' sub). Tbg landed w/ 10,000# set-down wt.

10/1: Prep to perf. RU and ran in hole w/Archer-Reed to fish for tools to knock out plug. Made gauge run to 12,500'. Pulled out of hole and ran fishing tools to 15,150. Picked up fish - pulled to btm of tbg. Jarred into tbg and jarred off fish. Ran down, shearing jars. Picked up fish and jarred out of hole. Rec 2 sinker bars. Ran back in hole to 32' and rec remainder of fish. Jars badly bent. RD Archer-Reed. RU McC and ran in hole to perf. Collar locator stopped working. Pulled out of hole - line stranded @ 150'. Made necessary repairs.

10/2: Perforating. Made perf run #2. Shot one hole @ 13,156' - had five wild shots @ approx 13,219, 13,296, 13,354, 13,375, 13,401±. Press from 600-2400 psi. Made perf run #3. Shot one hole @ following depths: 13,233, 13,310, 13,368, 13,389, 13,415, 13,432, 13,444, 13,497, 13,522, 13,560, 13,569, 13,618, 13,630, 13,643, and 13,685. Press from 2900-2750 psi. Stranded line coming out of hole, taking 7½ hrs to trip out. RD McC. OCT 2 1972

13,375	13,560	13,738	14,240	14,859	

Total of 47 perforations.

PROPOSED WORK:

Check for scale, cleanout if necessary, reperforate existing zones to a shot density of one hole per foot of pay and stimulate with 30,450 gal 15% HCl.

PROCEDURE:

1. Change out 5,000# tree to 10,000# tree.
2. Cut wax. Pull collar stops. Run sinker bars to 15,127+'.
.
3. Pump 2500 gal 15% HCl containing the following additives per 1000 gal: 3 gal G-10, 3 gal C-15, 3 gal J-22, 30# OS-160 Wide Range Unibeads, 30# OS-160 Button Unibeads. Disperse 50, 7/8" RCN ball sealers (SG 1.24) evenly throughout the acid. Flush with 4000 gal clean produced water or fresh water w/2% NaCl containing 3 Gal G-10 per 1000 gal.
4. Run sinker bars w/guage ring to 15,127+'.
.
5. Perforate one hole at each of the following depths (depths refer to CNL dated 9/7/72):

13,450	13,647	13,737	14,152	14,695	14,929	
13,451	13,648	13,767	14,153	14,696	14,931	
13,502	13,649	13,769	14,154	14,721	14,932	
13,503	13,650	13,839	14,155	14,722	14,933	
13,526	13,651	13,841	14,190	14,723	14,934	
13,527	13,689	14,029	14,239	14,724	14,954	

total of 95 additional perforations.

Note: a. Perforate unidirectionally with a 2" steel, hollow carrier gun; decentralize with magnets at top, middle and bottom of gun assembly. Use Harrison "RT" or Schlumberger Hyperjet 6.2 gram charges.

b. Note and record pressure changes during and after perforating.

6. Flow at maximum possible rate (record wellhead pressure and estimated rate, i.e., on 1" choke).

7. Acid treat gross perforated interval 13,156' to 15,128' with 30,450 gal (725 bbls) of 15% HCl acid as follows:

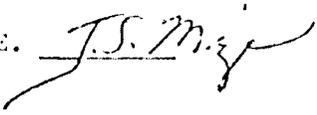

a. Pump 5 bbls 15% HCl acid.

b. Drop two 7/8" RCN ball sealers (S.G. 1.24) then pump 5 barrels 15% HCl acid.

- c. Repeat Step (b) 141 additional times for a total of 705 barrels and 282 ball sealers.
- d. Pump an additional 10 barrels without unibeads.
- e. Flush with 5960 gal (\pm 142 bbls) of fresh water containing 1245 lb. NaCl and 3 Gal G-10 per 1000 Gal (13% NaCl by weight).

- Note:
- 1) All acid except last 10 barrels (refer to Step 3(d) to contain the following additives per 1000 gal: 3 Gal G-10, 3 Gal C-15, 3 Gal J-22, 30# OS-160 Wide range Unibeads, 30# OS-160 Button Unibeads.
 - 2) Heat all fluids to 80°F.
 - 3) Place and hold 3500 psi on tbg - CSG Annulus.
 - 4) "Balling-out" at maximum allowable surface pressure is desirable, therefore; if "ballout" occurs before all acid is injected into the formation, hold 10,000 psi wellhead pressure for at least 3 minutes before bleeding back. Backflow briefly, then recommence injecting remainder of acid and ball sealers. If subsequent "ball-out" occurs, repeat the preceding sequence. Do not cut out balls from acid until several complete "ball-outs" have Occurred.
 - 5) Record (instantaneous) shut-down pressure and decline overnight with continuous pressure recorder.
 8. Open well and clean-up at maximum rate of 1" choke if possible; record flowing pressures and any shut-in pressures. Keep record of load and ball sealer recovery.
 9. Put well on production.

REMEDIAL PROGNOSIS
TEW 1-9B5
SECTION 9, T2S, R5W
ALTAMONT FIELD, UTAH

Pertinent Data:

Shell's Share: 99.2%

Elevation (KB): 7073'

Elevation (GL): 7047'

TD: 15,337'

PBTD: 15,150' (7" RBP at 10,872', 7" CR at 11,040', 7" CIBP at 11,698')

Casing: 13-3/8", 68#, K-55 to 351'; 9-5/8", 40#, K-55 and N-80 to 5841'; 7",
26#, S-95 and P-110 to 11,698'

Liner: 5", 18#, N-80 and S00-95; top at 11,716', bottom at 15,270'

Tubing: 2-7/8", EUE, 6.5#, N-80 to 10,054'

Packer: 7" Baker Model C fullbore at 10,054'

Perforations: 10,121'-15,127' (266 holes) - See current status. *Seems to be to great an interval*

Objective: CO, perforate, and stimulate the Wasatch.

Procedure:

1. MIRU. Load hole with clean produced water. Remove tree. Install and test BOPE as per field specs.
2. Pull tubing and 7" fullbore packer at 10,054', laying down gas lift mandrels while coming out.
3. RIH and retrieve Baker 7" RBP at 10,872'. RIH with mill and mill out 7" CR at 11,040', cement plug, and 7" CIBP at 11,698'. CO 5" liner to 15,150' (PBTD).
4. Rig up perforators with lubricator (tested to 3000 psi) and perforate as follows:
 - a. Perforate using a 3-1/8" O.D. Casing gun with DML Dens-Jet XIV (14.0 gram) charges at 120° phasing.
 - b. Record and report wellhead pressure before and after each run.
 - c. Perforate (from bottom up) 3 shots per foot at depths shown on Attachment I. Depth reference is McCullough's GR/CBL dated 9/26/72.
5.
 - a. If well can be controlled with water after perforating, run a 5" full-bore packer on tubing and set at +13,270'. Test tubing to 6500 psi.
 - b. If well cannot be controlled with water after perforating, lubricate in a 5" Model "FA-1" packer with Model "B" expendable plug in place and set at +13,270'. Run in with latch-in seal assembly. Latch into packer at +13,270' and pressure test tubing to 6500 psi. Run in with sinker bars and jars on wireline and knock out expendable plug from packer at +13,270'. Allow well to flow for +1 day to clean up perfs or until well can be controlled with water. Continue to Step 6.
6. Acid treat perfs 15,128'-13,361' (276 new, 139 old) with 35,000 gallons of 7-1/2% HCL as follows:

- a. Pump 1000 gallons 7-1/2% HCL.
- b. Pump 4000 gallons acid, dropping one ball sealer (7/8" RCN with 1.2 S.G.) every 100 gallons.
- c. Pump 1000 gallons acid containing 1000# benzoic acid flakes.
- d. Repeat Step (b) 6 more times and Step (c) 5 more times for a total of 7 stages acid and 6 of diverting material (total 35,000 gallons acid and 280 ball sealers).
- e. Flush with 110 bbls of clean produced water.

- Notes:
- (1) All acid and flush to contain 5 gallons G-10/100 gallons HCL or equivalent for + 70% friction reduction and 1.0# 20-40 mesh RA sand per 1000 gallons (no RA sand in flush).
 - (2) All acid to contain 3 gallons C-15/1000 gallons HCL for 4 hours exposure at 210°F and the necessary surfactant (tested for compatibility with formation fluids).
 - (3) Maintain 2500 psi surface casing pressure during treatment if possible.
 - (4) Pumping rates: pump at maximum possible without exceeding 6500 psi differential pressure between tubing and annulus.
 - (5) Increase amount of diverting material if necessary to obtain a gradual increase in treating pressure and/or decrease in rate.
 - (6) Record ISIP and shut-in pressure decline for at least 20 minutes.

7. Run RA log from PBSD to 13,200'±.
8.
 - a. If well flows, release rig and put on production. When well can be controlled with water, move in rig and proceed to Step 9.
 - b. If well does not flow, continue with Step 9.
9.
 - a. If a 5" fullbore packer was used in Step 5, POOH with tubing and packer. RIH with 5" RBP and 5" fullbore packer. Set RBP at 13,270'. Pressure test to 3000 psi. If okay, spot 1 sack of sand on plug (at field's discretion).
 - b. If a 5" Model "FA-1" packer was used in Step 5, POOH with tubing. RIH with Model "D latching" plug. Pressure test plug to 3000 psi. If okay, spot 1 sack of sand on plug (at field's discretion).
10. Rig up perforators with lubricator (tested to 3000 psi) and perforate as follows:
 - a. Perforate using a 3-1/8" O.D. casing gun with DML Densi-Jet XIV (14.0 gram) charges at 120°F phasing.
 - b. Record and report wellhead pressure before and after each run.
 - c. Perforate (from bottom up) 3 shots per foot at depths shown on Attachment II. Depth reference is McCullough's GR/CBL date 9/26/72.

11. a. If well can be controlled with water after perforating, run a 5" full-bore packer on tubing and set at +12,050'. Test tubing to 6500 psi.
- b. If well cannot be controlled with water after perforating, lubricate in a 5" Model "FA-1" packer as previously stated in Step 5 (b) and set at 12,050'. Continue to Step 12.
12. Acid treat perms 13,245'-12,178' (108 new) with 24,000 gallons of 7-1/2% HCL as follows:
 - a. Pump 1000 gallons 7-1/2% HCL.
 - b. Pump 3000 gallons acid, dropping one ball sealer (7/8" RCN wth 1.2 S.G.) every 180 gallons.
 - c. Pump 1000 gallons acid containing 1000# benzoic acid flakes.
 - d. Repeat Step (b) 5 more times and Step (c) 4 more times for a total of 6 stages acid and 5 of diverting material (total 24,000 gallons acid and 100 ball sealers).
 - e. Flush with 110 bbls of clean produced water.

Notes: (1) All acid and flush to contain 6 gallons G-10/1000 gallons HCL or equivalent for +70% friction reduction and 1.0# 20-40 mesh RA sand per 1000 gallons (no RA sand in flush).

(2) All acid to contain 3 gallons C-15/1000 gallons HCL for 4 hours exposure at 210°F and the necessary surfactant (tested for compatibility with formation fluids).

(3) Maintain 2500 psi surface casing pressure during treatment if possible.

(4) Pumping rates: pump at maximum possible without exceeding 6500 psi differential pressure between tubing and annulus.

(5) Increase amount of diverting material if necessary to obtain a gradual increase in treating pressure and/or decrease in rate.

(6) Record ISIP and shut-in pressure decline for at least 20 minutes.

13. Run RA log from 13,270'± to 11,950'±.
14. a. If well flows, release rig and put on production. When well can be controlled with water, move in rig and proceed to Step 15.
- b. If well does not flow, continue with Step 15.
15. a. If a 5" fullbore packer was used in Step 11, POOH with tubing and packer.
- b. If a 5" Model "FA-1" packer was used in Step 11, POOH with tubing and seals. RIH and mill out 5" Model "FA-1".
16. a. If an RBP was used in Step 9 (a), circulate sand (if necessary) and retrieve BP. Proceed to Step 17.

- b. If a 5" Model "FA-1" packer with Model "D" latching plug was used in Step 9 (b), RIH and retrieve latching plug. RIH and mill out 5" Model "FA-1" packer. Proceed to Step 17.
17. RIH with tubing, GL mandrels, and 5" Model "FA-1" and 7" Model "C" fullbore. Set Model "FA-1" at 12,100'. Set fullbore at 10,050'. Install GL mandrels as shown in Attachment III.
18. Return well to production.
19. Report well tests on morning report until production stabilizes.

Shell Oil Company

P.O. Box 831
Houston, Texas 77001

December 30, 1983

Mr. Norm Stout
State of Utah
Natural Resources
Division of Oil, Gas & Mining
4241 State Office Building
Salt Lake City, UT 84114

Dear Mr. Stout:

TRANSFER OF OWNERSHIP AND ASSETS
FROM SHELL OIL COMPANY TO
SHELL WESTERN E&P INC.
STATE OF UTAH

In accordance with our recent conversation, the purpose of this letter is to reduce to writing that Shell Western E&P Inc. ("SWEPI"), a subsidiary of Shell Oil Company, has been formed. Shell Western E&P Inc. is a Delaware corporation with its offices located at 200 North Dairy Ashford Road in Houston, Texas. The mailing address is P. O. Box 831, Houston, TX 77001.

Effective January 1, 1984, Shell Oil Company will transfer portions of its oil and gas operations to Shell Western E&P Inc. and Shell Western E&P Inc. will assume all of the rights, interests, obligations and duties which Shell Oil Company currently has as a result of its exploration, development and production operations in the State of Utah.

As you are aware, Shell Oil Company is currently the holder of various permits and agency authorizations. In view of the fact that Shell Western E&P Inc. will assume all of the liabilities and obligations of Shell Oil Company's exploration and production activities within the state, we respectfully request that you transfer all permits or other authorizations from Shell Oil Company to Shell Western E&P Inc., effective January 1, 1984.

To support this request, a copy of the power of attorney appointing the undersigned as Attorney-in-Fact for Shell Western E&P Inc. is enclosed. On behalf of Shell Western E&P Inc., enclosed are recently issued Bond No. Shell 1835 and Bond No. Shell 1841. The bonds were issued by the Insurance Company of North America. In the near future, I shall request that the existing Shell Oil Company bonds be released.

It is my understanding, pursuant to our prior discussion, that this letter will comply with your requirement regarding the change in the name of the permittee.

Sufficient copies of this letter are being provided to your office so that a copy can be placed in each appropriate file. A listing of active wells is enclosed. Thank you in advance for your cooperation in this matter.

Yours very truly,

G. M. Jobe

Attention: Ms. Lisha Romero

This letter includes the information you requested on January 12, 1988 concerning the recent merger of ANR Limited, Inc. into ANR Production Company. Effective December 31, 1987 (December, 1987 Production), ANR Limited, Inc. merged into ANR Production Company; and henceforth, will continue operations as ANR Production Company. *No 235*

ANR Production Company will begin reporting and remitting the Utah Conservation and Occupation Taxes effective December, 1987 production for leases previously reported by ANR Limited, Inc. (Utah Account No. N-7245). ANR Production Company will use the new Utah Account No. N-0675, as assigned by the State of Utah. *N0675*

Please contact me at (713) 877-6167 if I can answer any questions on this matter.

Very truly yours,

Roger W Sparks
Roger W. Sparks
Manager, Crude Revenue Accounting

*Lisha,
I don't see any problem w/this. I gave a copy to Arlene so she could check on the bond situation. She didn't think this would affect their bond as the bond is set up for Coastal and its subsidiaries (ANR, etc.) No Entity Number changes are necessary. DTS 1-26-88*

(NOTE: Report results of multiple completion on Well Completion or Recompletion Report and Log form.)

17. DESCRIBE PROPOSED OR COMPLETED OPERATIONS (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work. If well is directionally drilled, give subsurface locations and measured and true vertical depths for all markers and zones pertinent to this work.)*

Proposed Procedure:

- MIRU. Kill well, NU BOPE. Release from the 5" FA-1 pkr & POOH w/tbg, 7" Hydrostatic pkr & gas lift eqpt.
- CO wellbore to liner top @ 11,999'.
- RIH & set 7" RBP @ + 11,520'. Spot 2 sx sand on RBP.
- RIH w/2-7/8" tbg open ended. Tag RBP. Perform 3000# Braden-head squeeze across perfs 10,121-11,483' w/300 sx cmt.
- CO wellbore to sand top. RIH w/pkr & pressure test squeeze. Repeat if necessary. CO well & retrieve BP.
- Mill out 5" FA-1 prod pkr @ + 12,100'. CO wellbore to +15,072'.
- Run csg inspection log across 7" 29# intermediate string from 0-10,100'.
- RIH w/5" CIBP & set @ + 13,470'. RIH w/RTTS pkr on 2-7/8" tbg & set @ + 13,285'. Establish injection rate.
- RIH w/cmt retainer & set @ + 13,285'. Inject 100 sx cmt into retainer & spot 2 sx on top. Est. cmt top @ + 13,260. (398 holes plugged off.)
- Perf Wasatch w/3 SPF using 3-1/8" csg gun @ 11,757-13,090'. See attached list of perf depths.
- RIH w/5" RTTS treating pkr & set @ + 11,745'. Acidize perfs from 11,757-13,245' w/10,000 gals 15% HCL + additives.
- Swab/flow back load. Kill well. POOH w/treating pkr. RIH w/gas lift production eqpt. Return well to production.

18. I hereby certify that the foregoing is true and correct

Perforation and Treatment History

October 1972: Perf 13,156'-15,127' (47 holes, 1 SPF). Acidize with 26,000 gals 15% HCl.
October 1974: Perf 13,156'-15,128' (95 holes, 1 SPF). Acidize 13,156' to 15,128' with 30,400 gals 15% HCl.
June 1975: Initiate gas lift.
January 1977: Set CIBP above Wasatch @ 11,698'. Perf Upper Wasatch and Green River 10,121'-11,692' (124 holes, 1 SPF). Acidize 10,121'-11,692' with 23,000 gals 15% HCl.
March 1977: Cement squeeze perfs 11,124'-11,692' (51 holes) w/200 sxs.
August 1977: Swab test 10,559'-10,919'; 11,006'-11,023'; 10,085'-10,545'.
August 1981: Perf 13,351'-15,112' (273 holes, 3 SPF). Acidize 13,361'-15,128' (412 holes) with 35,300 gals 7-1/2% HCl. Perf 12,178'-13,245' (108 holes, 3 SPF). Acidize with 24,000 gals 7-1/2% HCl. Install straddle packers across Green River from 10,044' to 12,100'.

May 1989: Cmt sqz perms 10,121'-11,483' (100 holes). Plug off 398 holes from 13,285' to 13,480'. Perf Wasatch from 11,757' to 13,080', 3 SPF, 231 holes. Acidize 11,757' to 13,245' (335 holes) w/10,000 gals 15% HCl.

Present Status: SI uneconomical

PROCEDURE

1. MIRU service rig. Kill well. NU BOPE and POOH w/2-7/8" tbg and gas lift equipment.
2. PU 7" 29# cmt retainer and RIH w/2-7/8" tbg. Set retainer at +/-10,000'. Circ hole clean. Pump 50 sxs cmt below retainer and spot 25 sxs cmt on top.
3. Spot 70 sxs cement plug (330') 5610' to 5940'.
4. Spot 50 sxs cement plug from 200' to surface.
5. Cut off 7", 9-5/8", and 13-3/8" csg 5' below ground.
6. Run 1" pipe and cement 7" x 9-5/8" and 9-5/8" x 13-3/8" annulus from 200' to surface (approximately 100 sxs total).
7. Set dry hole marker w/necessary inscription.

UTAH DIVISION OF OIL, GAS AND MINING
CONDITIONS OF APPROVAL FOR WELL PLUGGING AND ABANDONMENT

ANR Production Company
Tew #1-9B5 Well
Section 9, T. 2S, R. 5W
Duchesne County, Utah
November 9, 1989

Reference document: Sundry notice dated October 24, 1989.

1. The operator shall notify the division at least 24 hours prior to commencing plugging operations to allow witnessing by a division representative.
2. Step 6 shall be modified to allow for pumping cement into the casing annulus from the surface without using 1" pipe. This is the procedure used by the field crews working the wells and the division has approved such modifications in the past.

RE: Notice of Permit Application for Water Disposal Well. Coastal
Oil & Gas Tew #1-9B5. SE NE Section 9, T2S - R5W. Duchesne
County, Utah.

Dear Sirs,

This letter is to advise you that Coastal Oil and Gas Corporation
is requesting approval from the U.S. Environmental Protection
Agency to inject water produced from Altamont Field into the Tew
#1-9B5.

You are herein provided with a copy of the submitted permit for
this well. This permit contains a section for the State of Utah
which includes a filled out permit UIC Form 1. Should you have any
questions or comments please do not hesitate to contact me or the
U.S. Environmental Protection Agency.

Sincerely,

Lawrence T. Hartnett, P.E.
Consultant

Re: Application to Convert the TEW 1-9B5 Well Section 9, Township 2 South, Range 5 West, Duchesne County, Utah to a Salt Water Disposal Well

Dear Mr. ^{Harry}Hartnett:

This letter is to advise you that the application to convert the above mentioned well to a salt water disposal well has been reviewed.

In general the application has been found technically complete, however the following actions are necessary to complete the application process and to facilitate a public notice for the well.

1. A list of all operators or owners within a one-half mile radius must be provided. This is in addition to the list of surface owners which was previously supplied.
2. An affidavit certifying that a copy of the application has been provided to said operators or owners within the one-half mile radius.

If you have any questions please call me at (801)538-5340.

Sincerely,

Dan Jarvis
UIC Geologist

---ooOoo---

IN THE MATTER OF THE APPLICATION	:	NOTICE OF AGENCY ACTION
OF COASTAL OIL & GAS CORPORATION	:	
FOR ADMINISTRATIVE APPROVAL OF	:	CAUSE NO. UIC-140
THE TEW 1-9B5 WELL LOCATED IN	:	
SECTION 9, TOWNSHIP 2 SOUTH,	:	
RANGE 5 WEST, U.S.M., DUCHESNE	:	
COUNTY, UTAH, AS A CLASS II	:	
INJECTION WELL	:	

---ooOoo---

THE STATE OF UTAH TO ALL PERSONS INTERESTED IN THE ABOVE ENTITLED MATTER.

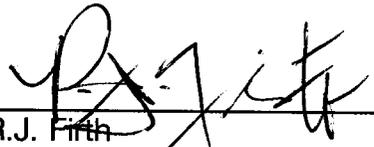

Notice is hereby given that the Division is commencing an informal adjudicative proceeding to consider the application of Coastal Oil & Gas Corporation for administrative approval of the TEW 1-9B5 Well, located in Section 9, Township 2 South, Range 5 West, Duchesne County, Utah, for conversion to a Class II injection well. The proceeding will be conducted in accordance with Utah Admin. R.649-10, Administrative Procedures.

The interval from 3700 feet to 6400 feet (Lower Uinta, Upper Green River Formation) will be selectively perforated for water injection. The average injection pressure is estimated to be 500 psig and the estimated injection volume will be 10,000 barrels of water per day.

Any person desiring to object to the application or otherwise intervene in the proceeding, must file a written protest or notice of intervention with the Division within fifteen days following publication of this notice. If such a protest or notice of intervention is received, a hearing will be scheduled before the Board of Oil, Gas and Mining. Protestants and/or intervenors should be prepared to demonstrate at the hearing how this matter affects their interests.

DATED this 15th day of December, 1993.

RE: Application to convert the TEW 1-9B5 well Section 9,
Township 2 South, Range 5 West, Duchesne County, Utah to a
Salt Water Disposal well

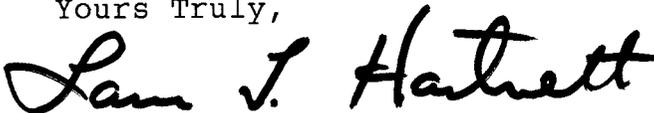

Dear Mr. Jarvis:

This letter is a follow up to our telephone conversation in regard to
your letter of November 16, 1993.

Coastal Oil & Gas Corporation is the operator within a one-half
mile radius of the TEW 1-9B5.

If you have any other questions, please call me at (303)238-2342.
Thank you very much for all the help that you have given me with
this permit.

Yours Truly,

Lawrence T. Hartnett, P.E.

XI. ATTACHMENTS**A. AREA OF REVIEW METHODS AND NOTIFICATION OF LAND OWNERS**

The area of review is a fixed radius of one-quarter (1/4) mile from the well bore. The property owner in Section 9 is the William Frederick Tew Family Limited Partnership, Star Route 120, Talmage, Ut 84073. The property owner in Section 10 is also the William Frederick Tew Family Partnership. Coastal has a letter agreement with the Tews setting up the disposal well. See Exhibit "A" for a copy of the letter. The Utah Division of Oil, Gas & Mining has requested Coastal notify surface owners within 1/2 mile radius of the injection well. This would add the Lytel et al group, 47 Corte Mesa Drive, San Rafael, Ca 94901. See Exhibit "A2". The Uintah & Ouray Agency, Ft. Duchesne, UT 84026 will also receive a copy of this permit.

See Exhibit "A1" for a copy of the correspondence to all parties and Exhibit "A3" for a copy of the affidavit of mailing.

B. MAPS OF WELLS AND AREA OF REVIEW

Topographic and well location maps are submitted as Exhibit "B1" and "B2".

C. CORRECTIVE ACTION PLAN AND WELL DATA

There are no other wells within the area of review.

E. NAME AND DEPTH OF USDWs

There are no known water wells within this Area of Review serving either livestock or households. The formations above the injection zone may have possible USDW zones (See Technical Publication No. 92, State of Utah, Department of Natural Resources). There have not been any tests run to measure what the TDS of the Uinta and Upper Green River (TGR 1) zones are in this well. See Exhibit "E" for logs.

G. GEOLOGICAL DATA ON INJECTION AND CONFINING ZONES

The zones proposed to inject into are the Uinta and Upper Green River (TGR 1). The part of the Uinta zone to be injected into is approximately 2100' thick from 3700' to 5800'. The part of the Upper Green River (TGR 1) zone to be injected into is approximately 500' thick from 5900' to 6400'. The Uinta Formation goes to the surface. The zone below Upper Green River Formation is the TGR 3.

All these zones including the lower confining zone are made up of shale and siltstone with interbedded sand lenses. The fracture gradient of the injection zones have not been determined, so a gradient of .733 is assumed. The TDS content may range from 64,000 ppm to 68,000 ppm. See Exhibit "G".

H. OPERATING DATA

1. a. Average daily injection rate - 10,000 BPD
b. Maximum daily injection rate - 15,000 BPD
c. Total volume of fluid to be injected - 73,000,000 Bbls
2. a. Average injection pressure - 500 psi
b. Maximum injection pressure - 1100 psi
((.733-.433)*3700)
3. Nature of annulus fluid - fresh water mixed with corrosion inhibitor or "packer fluid".
4. Coastal owns and operates interest in certain wells in the Altamont Field. The water to be injected into the Tew #1-9B5 will come from wells in the Altamont Field. A list of the source wells is in Exhibit "H".
5. A sampling of different wells in the field have had a water analysis run. See Exhibit "H1".

J. STIMULATION PROGRAM

The Uinta and Upper Green River zones will be acidized with 16,000 gallons of 15% HCL, rock salt, and BAF (diverter) in 4 stages. All acid to contain inhibitor, friction reducer, iron sequestering agent, and surfactant. Pump at max possible rate (12-15 BPM), not to exceed 5000 psi. Hold 2000 psi on casing during job. See Exhibit "M" for more details.

K. INJECTION PROCEDURES

The injected fluid will be delivered to the disposal site by pipeline. The proposed injection procedure will be with two Triplex pumps pumping down tubing into the injection zone. There will be 3-1000 bbl tanks, 1-500 bbl skim tank, and 1-500 bbl clear water tank on location that will be feeding the triplex pumps. There will be level controllers on the storage tanks to shut down the pumps when the tanks run out of fluid. There will be a pressure controller on the pumps to shut them down if the pressure exceeds the maximum injection pressure.

L. CONSTRUCTION PROCEDURES

To improve the cement bonding of the injection zone and the zones above and below the injection zone, a cement bond log with gamma ray will be run from 9560' to surface with 2000 psi held on the 7" casing. Any zones that need to be squeezed will be squeezed. See Exhibit "M".

M. CONSTRUCTION DETAILS

The Tew #1-9B5 was drilled to a depth of 15,337' with a 17 1/2" hole from surface to 351', a 12 1/4" hole from 351' to 5841', 8 3/4" hole from 5841' to 11,999', and 6 1/8" hole from 11,999' to TD. 13 3/8" 68# casing set to 351', 9 5/8" 40# casing set to 5841', 7" 29# casing set to 11,999', and 5" 18# casing was set as a liner from 11,716' to 15,270'. Plug back depth was 15,072'. The 13 3/8" casing was cemented with 700 sacks, the 9 5/8" casing was cemented with 1300 sacks, the 7" casing was cemented with 400 sacks, and the liner was cemented with 701 sacks of cement. Cement top of the 13 3/8" casing is at surface, the cement top of the 9 5/8" casing is at surface, the cement top of the 7" casing is at 9961', and the cement top of the 5" liner is at top of the liner. The well has been squeezed at 1565' with 1200 sacks, squeezed at 6004' to 6035' with 850 sacks, and squeezed at 10,121' to 11,483' with 300 sacks. The well has been perforated from 13,260' to 15,128', 11,757' to 13,245', and 10,121' to 11,483'. The well has been plugged and abandoned. The ground level elevation is 7047'. See Exhibit "M1" for original Completion Report, Exhibit "M2" for Chronological History since 5/89, and Exhibit "M3" for present well schematic. To set the well up to be an injection well the following work will be done. Drill out cement plugs. Test casing and run cement bond log from 9560' to surface. Do squeeze jobs as needed. Run sonic log to check injection zones. Perforate Uinta Formation from 3700' to 5800' with 4 SPF with 4" casing gun. Perforate Upper Green River Formation from 5900' to 6400' with 4 SPF with 4" casing gun. Swab zones for water samples. Acidize zones. Run packer and tubing. Circulate treated, non-corrosive production water for packer fluid. Set packer at 3600'. Run MIT test on tubing annulus. Set well up to inject produced water. See Exhibit "M4" for injection well schematic.

O. PLANS FOR WELL FAILURES

In the event that the well is shut-in, whether manually or automatically, Coastal will take the following steps.

1. Determine the nature and extent of the failure causing the shut in.
2. In the event that the well can not continue to operate as stipulated by the UIC Permit, the well will be shut-in temporarily, unless permission is obtained from the EPA to continue.
3. An EPA representative will be contacted to discuss the reason for the failure and further steps to be taken.
4. If shut-in is imminent, the following step will be taken:
 - a. Divert produced water intended for the Tew #1-9B5 well to other authorized facilities.

P. MONITORING PROGRAM

Coastal will monitor water quality of the injected fluids on an annual basis. Analysis will include total dissolved solids, PH, specific conductivity and specific gravity. Any time there is a change in the source of injection fluid, a new water quality analysis will be done and submitted to EPA.

Q. PLUGGING AND ABANDONMENT PLAN

The plugging and abandonment plan for this well includes cement in the 7 inch casing to assure protection of all USDWs and retention of fluids in formations in which they are contained in the event that after abandonment casing should fail at some point.

The specific plans are as follows:

Plug #1 Within the casing, set a cement retainer above the perforations at 3600' and squeeze with 500 sacks class "G" cement. Unsting from retainer and dump any excess cement on top of retainer (Minimum of 10 sxs).

Plug #2 Place plug at 200'. Cement to surface with 30 sacks class "G" cement filling the 7" casing.

See Exhibit "Q1" for EPA form 7520-14.

See Exhibit "Q2" for Plugging and Abandonment Schematic.

R. **NECESSARY RESOURCES**

Coastal has a Financial Responsibility letter on file with the EPA. This well is to be added to that responsibility.

S. **AQUIFER EXEMPTIONS**

The water in the Uinta and Upper Green River (TGR 1) Formations are expected to have total dissolved solids in excess of 10,000 parts per million; therefore no exemption of that reservoir will be necessary.

U. **DESCRIPTION OF BUSINESS**

Coastal is an exploration and production company of hydrocarbons.

V. **STATE OF UTAH PERMIT**

See Exhibit "V" for UIC FORM 1. See Exhibit "V2" for map of wells within 1/2 mile. See Exhibit "V1" for information on well with 1/2 mile. This well has been plugged and abandoned.

RECEIVED
APR 26 1993
EXPLOITATION-DEN

March 15, 1993

Mr. William Fred Tew &
Mrs. Sandra W. Tew
Talmage, Utah 84073

RE: Produced Water - Disposal
Re-Entry Tew 1-9B5
Sec. 9 T2S,R5W
Duchesne County, UT

Dear Mr. & Mrs. Tew:

We have secured management permission to enter into an agreement, even though the final project to convert the subject well has not been approved. Therefore please accept the following as a binding agreement that when executed by you will start the agreed upon consideration of \$625.00 per month. In the event the conversion project as contemplated herein is not approved we reserve the right to notify you thirty days in advance and terminate this agreement with no further consequences accruing.

On this 11th day of March 1993, William Fred Tew and Sandra W. Tew (hereinafter referred to as Tews) for and in consideration of the sum of \$625.00 Six Hundred twenty five dollars, due and payable by ANR Production Company (hereinafter referred to as ANR) upon ANR's receipt of a fully executed copy of this agreement on or before April 20, 1993, do hereby grant assign and convey unto ANR a Water Disposal Agreement which will include the following terms and such others as the parties may mutually agree:

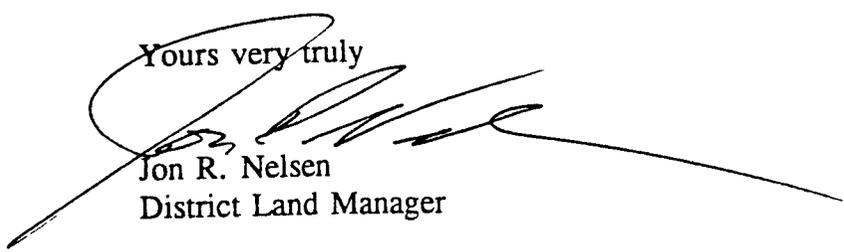

- 1) ANR will be granted the exclusive right to enter the abandoned well bore of the Tew #1-9B5 located in the NE/4 of Section 9 Township 2 South, Range 5 West Duchesne County, Utah and convert same to dispose of produced water from the Altamont-Bluebell Field. This grant will include such land and rights-of-way necessary to implement the project, including but not limited to existing road and pipeline right of ways, use of electrical and public services as are necessary;
- 2) ANR will secure a valid permit from the state of Utah, and will assume **full liability** for its operations of a disposal facility, further ANR shall hold the Tews harmless for any of its operations related thereto;
- 3) The majority of the water to be disposed of will be piped to location instead of being transported in by truck;

Mr. & Mrs Tew
March 15, 1993
Page 2

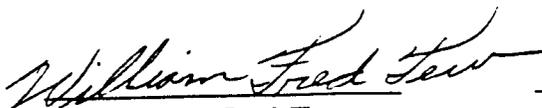

- 4) ANR will properly restore the premises as a prudent operator;
- 5) The agreement will be for a term of 20 years, but can be terminated by ANR upon 30-day written notice to the Tews at the address shown above.
- 6) The consideration to the Tew's for the forgoing agreement shall be the sum of \$625.00 per month. The initial \$625.00 payment shall include settlement of full damages for the actual conversion and the pipeline installation to the Chevron line, north of the location provided that such operation is conducted in a prudent manner and and appropriate cleanup is performed. Any damages subsequent to the above named operations under this agreement shall be negotiated separately.
- 7) Upon completion of the conversion and the installation of the necessary pipelines, ANR will prepare a recordable Grant and Easement specifying exactly which of the Tew lands that it is using under the agreement. The Tews agree to execute same and ANR will cause it to be recorded.

Please review this Agreement carefully and if it meets with your agreement and acceptance, please sign and return the attached copy in the envelope provided. Again thank you for your consideration in this matter.

Yours very truly

Jon R. Nelsen
District Land Manager

RE: Notice of Permit Application for Water Disposal Well. Coastal Oil & Gas Tew #1-9B5. SE NE Section 9, T2S - R5W. Duchesne County, Utah.

Dear Sirs,

This letter is to advise you that Coastal Oil and Gas Corporation is requesting approval from the U.S. Environmental Protection Agency to inject water produced from Altamont Field into the Tew #1-9B5.

You are herein provided with a copy of the submitted permit for this well. Should you have any questions or comments please do not hesitate to contact me or the U.S. Environmental Protection Agency.

Sincerely,

Lawrence T. Hartnett, P.E.

Present Status: Well P&A'd 1/18/90.

RECOMMENDED PROCEDURE

1. MIRU workover rig. (Note: Give State of Utah 24-hour notice prior to moving in.)
2. Dig out cellar. Weld on 7" 26-29# S-95 landing joint & horse collar to 9⁵/₈" csg. Install 7" 5000# csg head flange. NU 6" 5000# WP BOP's (7-1/16" bore).

SWD CONVERSION PROCEDURE

TEW #1-9B5

PAGE 2

- 3) RIH w/6" drag bit. Drill out surface plug @ surface to 200'. Pressure test 7" csg above 5500' to 2000#. Drill out cmt plug @ 5500-5940' (440'). RIH & CO 7" csg to PBSD @ 9560'. Pressure test 7" csg to 2000#. If 7" csg leaks, consider Casing Inspection Log and squeeze as needed. POH w/bit.
- 4) Run a GR/CBL log from 9560' to surface w/2000# to determine cmt coverage.
- 5) From the CBL log, perf 7" csg & set a cmt retainer to isolate the proposed Upper Green River perms @ ±5900-6400'. Squeeze w/necessary cement as required.
- 6) Perf & set a cmt retainer to isolate the proposed Uinta perms @ ±3700-5800'. Squeeze with necessary cement as required. WOC.
- 7) PU 6" mill & drill out squeezes. Pressure test each to 2000# after drillout. Circulate & condition hole. POH.
- 8) Run a GR/CBL log across proposed zones of interest w/2000#. Re-squeeze as necessary.
- 9) Run a SDT/CNL/GR Digital Sonic log from 8000' to surface to determine proposed injection zones in well. (Note: No open hole logs were run above 5841' due to hole problems.)
- 10) RU wireline w/lubricator. Perforate the proposed Uinta selectively @ ±3700-5800' and the Upper Green River (TGR1) @ ±5900-6400' @ 4 SPF w/4" csg gun. Correlate to the SDT Sonic log.
- 11) RIH w/Mtn States retrievable pkr & bridge plug on 2 7/8" tbg. Isolate perforated intervals @ 3700-5800' and 5900-6400' and swab test separately for analysis of formation water as required by the State of Utah and BLM.
- 12) Set pkr above all zones @ ±3500'. Acidize Uinta & Upper Green River zones w/16,000 gal 15% HCl + rock salt & BAF (diverter) in 4 stages.
Note: A) All acid to contain inhibitor, friction reducer, iron sequestering agent and surfactant.
B) Pump at max possible rate (12-15 BPM), not to exceed 5000 psi.
C) Hold 2000 psi on csg during job.
- 13) POH w/pkr & RBP.
- 14) PU 3 1/2" "F" nipple (PC), 4' - 3 1/2" pup jt (PC), Mtn States Lok-set pkr (PC) w/on-off tool and 3 1/2" 9.3# J-55 8rd tbg (internal coated w/Duoline-20 fiberglass & Threadmaster MMS couplings, Burst 6980 psi, Collapse 7400 psi, Tension 142,000#, max temp 300°F). Pressure test tbg to 5000 psi. Circ treated, non-corrosive production water for pkr fluid. Set pkr @ ±200' above uppermost perf w/18-20,000# tension. Test annulus to 2000 psi.
- 15) Land tbg. ND BOP, NU injection WH. RDMO rig.

- 16) Establish step-rate injectivity test into the Uinta & Upper Green River injection intervals to determine maximum allowable injection pressure.
- 17) Hook up injection pump & lines. Install SWD battery.
- 18) Obtain SWD permit.
- 19) Place well on saltwater injection.

Re: Tew 1-9B5 Well, Section 9, Township 2 South, Range 5 West, Duchesne County, Utah

Gentlemen:

Pursuant to Utah Admin. Code R.649-5-3-3, the Division of Oil, Gas and Mining (the "Division") issues its administrative approval for conversion of the referenced well to a Class II injection well. Accordingly, the following stipulations shall apply for full compliance with this approval:

1. Compliance with all applicable requirements regarding operation, maintenance and reporting for Underground Injection Control ("UIC") Class II injection wells pursuant to Utah Admin. Code R.649-1 et seq.
2. Conformance with all conditions and requirements of the application submitted by Coastal Oil and Gas Corporation.
3. Provide notification to the Division at least forty-eight hours prior to commencing the conversion work on the well.
4. Run a cement bond log from 9560' to the surface and perform squeeze cementing operations as necessary to isolate the injection intervals.
5. Swab test the intervals above 5800' and below 5900' separately and obtain representative water samples for analysis. Submit analysis results to the Division so that a determination can be made as to the need for an aquifer exemption prior to commencing injection.

Page 2
Coastal Oil and Gas Company
Tew #1-9B5 Well
January 31, 1994

6. Conduct a mechanical integrity test and a step-rate test to obtain frac gradient information.

Following the completion of well conversion work, pressure testing, and other operations and submittal of the required documents to the Division, a final UIC permit will be issued. If you have any questions regarding this approval or the necessary requirements, please contact Dan Jarvis at this office.

Sincerely,

R.J. Flinn
Associate Director

**DIVISION OF OIL, GAS AND MINING
UNDERGROUND INJECTION CONTROL PROGRAM**

**PERMIT
DECISION DOCUMENT**

Applicant: Coastal Oil and Gas

Well: TEW 1-9B5

Location: Sec. 9, T.2 S., R.5 W., Duchesne County

Ownership Issues:

The proposed well is located in section 9, township 2 south, range 5 west, Duchesne County, Utah. The surface location is owned by the Tew Family estate, Coastal Oil and Gas is the operator of all leases in the 1/2 mile radius. An affidavit has been filed stating that all surface owners in the 1/2 mile area have been notified.

Well Integrity:

The well proposed for injection is the Tew 1-9B5. This well has a 13 3/8" surface casing set at 351 feet and is cemented to surface. A 9 5/8" intermediate casing was set from surface to 5841 feet and cemented to surface. A 7" liner was set from surface to 11999 feet with a cement top at 9961 feet. A squeeze was performed on the 7" casing from 6004-6035 feet on 1/16/90. Additional squeeze jobs are planned from 5900-6400 feet and from 3700-5800 feet at the time of conversion. The proposed zone of injection lies within the lower Uinta Formation and the upper Green River Formation at a depth of 3700-6400 feet. A 2 7/8' tubing will be set in a packer at 3600 feet. The zones will be perforated and swabbed to obtain a representative sample. There is 1 abandoned well in the 1/2 mile area of review. The abandoned well has proper plug placement to adequately protect any usdw's. A casing test should be performed at the time of conversion and a casing/tubing pressure test should be performed prior to injection.

Ground Water Protection:

The base of moderately saline water may be as deep as 7500 feet in the area, it appears that this may be a case where there are zones of fresher water that underlie zones of more saline water. The upper zone of proposed injection lies within the saline facies, the lower zone needs to be swabbed to determine the quality of the water. There are no water wells in the area that penetrate more than 200 feet. Any fresh and usable waters would be contained in the surface alluviums and down into the Duchesne River Formation. The upper confining zone consists of impermeable shale and limestone beds of the Uinta Formation. The lower confining zone consists of shale, limestone, and sand stringers of the Green River Formation. Any shallow fresh water zones will be adequately protected by the existing construction. No corrective action is needed on the offset well.

Oil/Gas & Other Mineral Resources Protection:

Injection into this well should have no adverse affects on any offsetting production. There are no other known mineral interests of concern.

Bonding:

Coastal Oil and Gas has a statewide bond in the amount of \$80,000 dollars.

Actions Taken and Further Approvals Needed:

A public notice for the injection well was published in both the Salt Lake Tribune and the Uinta Basin Standard newspaper. No objections to the application were received. The permittee needs squeeze the above mentioned zones, run cement bond logs through and above the proposed zone of injection and swab a representative sample once the casing has been perforated. A step rate test needs to be run to verify the assumed frac gradient of .733 psi/ft..

Denver, Colorado 80201

RE: UNDERGROUND INJECTION CONTROL (UIC)
Final Permit UT2722-03788 for
Disposal Injection Well TEW #1-9B5,
Altamont Field, Duchesne County, Utah

Dear Mr. Bartley:

Transmitted herewith is your Underground Injection Control (UIC) Final Permit for your TEW #1-9B5 SWD (UT2722-03788) disposal injection well, Altamont Field, Duchesne County, Utah.

The public comment period on the proposed permit action ended on May 27, 1994. There were no comments from either you, the general public, or the landowners who may have been affected by the proposed permit action.

Please note that under the terms of the final permit, you are authorized **ONLY to construct the proposed injection well**. To begin injection, you must fulfill Permit Condition Part II.C.1., Prior to Commencing Injection, and receive notice from the Director to commence injection. In summary, these Part II.C.1. requirements for your injection well are:

- (a) **Conversion construction is complete** (according to the requirements in Part II. Sections A & B) and the permittee has submitted a **Well Rework Record, Form 7520-12** (in Appendix B); and
- (b) The permittee has:
 - (i) **completed Formation Testing** requirements (Part II, Section A. 5.);

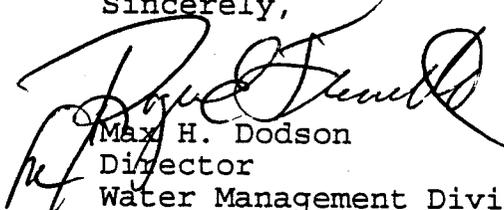

Printed on Recycled Paper

- (ii) demonstrated that the well has mechanical integrity (Part II. Section C. 2.);
- (iii) submitted a Cement Bond Log, which identifies adequate bonding above the 1660 foot squeezed zone; and
- (iv) received written notice from the Director that such demonstrations are satisfactory.

You may telephone the Permit Writer, Gustav Stolz, to make the necessary arrangements for EPA to witness the required mechanical integrity test(s).

Please also direct any additional questions you may have to the attention of Gustav Stolz at Mail Code 8WM-DW, or you may telephone him at (303) 293-1416.

Sincerely,

Max H. Dodson
Director
Water Management Division

DESCRIPTION OF FACILITY AND BACKGROUND INFORMATION

On October 25, 1993, Coastal Oil & Gas Corporation, Denver, Colorado, made application with the Environmental Protection Agency (EPA) for an underground injection control (UIC) permit. The UIC permit application is for the disposal injection of Green River and Wasatch Formations produced water from the Altamont-Bluebell Field, Duchesne County, Utah. The proposed injected waters composition range from 18,600 to 36,664 mg/l total dissolved solids (TDS). These produced waters are to be injected into the converted Plugged and Abandoned (PA) Altamont Field TEW #1-9B5 well located 2334 feet FNL and 1201 feet FEL (SE NE) Section 9, Township 2 South Range 5 West in Duchesne County, Utah.

Injection shall be for the purpose of disposing of produced Green River and Wasatch Formations water within the Altamont-Bluebell Field. Injection will be into the combined Uinta Formation interval of 3,700-5,800' and Upper Green River (TGR-1) Formation interval of 5,900-6,400' injection zones in the existing plugged and abandoned

Altamont TEW #1-9B5 SWD well. The proposed injection pressure is approximately 790 psig; this value was calculated assuming a sand-face fracture gradient of 0.65 psi/ft and an injected water Specific Gravity of 1.006. This initially calculated injection pressure may be increased on the basis of data obtained from the required Step Rate Injectivity Test which is to be conducted after injecting for approximately six months. The proposed average injection rate is an average 400 BWPD (barrels of water per day), with a proposed maximum of 15,000 BWPD of Green River and Wasatch Formations (67,585 mg/l) produced water. The permittee will be required to obtain and analyze uncontaminated swab samples of the injection zone fluids during the completion program and prior to any fluid injection. The existing formation pore pressure of the injection zone must also be determined during the well completion program. Results of these tests will be submitted to EPA prior to authorization to inject into the proposed Uinta and Green River Formations intervals. Electric log data (from nearby wells) was used to make water quality calculations for each of the permeable formation intervals above the injection zones to the surface casing shoe. No underground sources of drinking water (USDWs) exist above or below the proposed injection zones at this location.

Coastal Oil & Gas Corporation has submitted all required information and data necessary for the issuance of an injection permit in accordance with 40 CFR Parts 144, 146, and 147, and an appropriate draft permit has been prepared.

Based on data submitted by Coastal Oil & Gas Corporation, none of the shallower formations (to the surface) are considered underground sources of drinking water (USDW) aquifers under the Environmental Protection Agency (EPA) requirements. The total dissolved solids (TDS) content of each of these ground waters is greater than 10,000 milligrams per liter (mg/l) and cannot be expected to supply a public water system.

The Altamont TEW #1-9B5 proposed injection facility is located in the Altamont Field at SE/4 of NE/4 of Section 9, T2S R5W.

The permit will be issued for the operating life of the water disposal injection operation in the Altamont Field area; therefore, no reapplication will be necessary unless the permit is terminated for reasonable cause (40 CFR §§ 144.39, 144.40). However, this permit will be reviewed every five years.

This Statement of Basis gives the derivation of the site specific permit conditions and reasons for them on the basis of the direct implementation regulations promulgated for the Uintah and Ouray Indian Reservation under the UIC program provisions of the Safe Drinking Water Act. The general permit conditions for which the content is mandatory and not subject to site specific differences (based on 40 CFR Parts 144, 146, and 147), are not included in the following discussion.

Part II.
Section A - WELL CONSTRUCTION

Casing & Cementing.

(Condition 1)

The conversion details submitted with the permit application are hereby incorporated into this permit as Appendix A, and shall be binding on the permittee. The casing strings-cement programs for the "as-is" well construction are as follows (assuming the use of Class "B" cement throughout):

(a) The 13 3/8-inch, 68-pound per foot surface casing was cemented to surface in 17 1/2-inch hole from 351' Kelly Bushing (KB) with 700 sacks of Class "B" cement.

(b) The 9 5/8-inch, 40-pound per foot intermediate string casing was cemented in 12 1/4-inch hole from a depth of 5,841' KB to a calculated TOC at 2,074' with 1300 sacks of Class "B" cement. The 9 5/8-inch, 40 pound per foot intermediate string was then perforated at a depth of 1,565' and squeezed to surface with 1200 sacks Class B cement.

(c) The 7-inch, 29-pound per foot production (long string) casing was cemented in 8 3/4-inch hole from total depth (TD) at 11,999' KB to the top of cement (TOC) at approximately 9,961' KB with a total of 400 sacks of Class "B" cement. The 7-inch casing was perforated at 6,004' and 850 sacks Class "G" Hy-Fill cement were squeezed in open hole to the intermediate string shoe at 5,841', and inside the 9 5/8-inch 40-pound per foot intermediate casing string to approximately 200' from the surface after numerous attempts. The 7" - 9 5/8" annulus was then filled with cement pumped from the surface.

(d) The 5-inch, 18-pound per foot liner (casing) was hung in the 7-inch long string casing and in the 6 1/8-inch hole drilled to a Total Depth (TD) of 15,337'. The liner was cemented from the liner hanger (at 11,716') to TD with a total of 701 sacks Class "B" cement; the plugged back total depth (PBD) is 15,072'.

All cement in the prior construction of the well was designed for the life expectancy of the well. The Plugged and Abandoned (P&A) existing dry hole well is proposed to be re-entered and constructed to injection service with appropriate minor changes in the existing construction. The 0-260' surface plug inside the 7-inch production casing, and the 5,500-5,900 plug across the intermediate casing shoe will be drilled out in the well conversion construction. The existing 7-inch retainer at 10,000' with the 440', 70 sack-cement cover plug will remain in-place undisturbed, as will the 5-inch bridge plug at 13,480' with 200 sacks of cement on top. These plugs will isolate the original, deep completion perforations.

The specific injection interval and construction modifications will be identified on the Well Completion Report (EPA Form 7520-10).

The proposed Conversion Completion Procedure for the existing Plugged and Abandoned dry hole is included in Appendix A. The Uinta Sand Formation at 3,700-5,800' and the Upper Green River Sand (TGR-1) Formation at 5,900-6,400' zones will be perforated for water disposal injection service.

Tubing & Packer Specifications. (Condition 2)

Injection tubing of 2 7/8-inch diameter will be utilized with an appropriate packer set at the proposed depth of approximately 3,600' KB inside the 7-inch long string casing. The permittee is required to set the packer at a distance of no more than 100 feet above the 3,700-foot top injection perforation. The casing/tubing annulus will be filled with corrosion-inhibited fresh water. Injection between the wellbore and the outermost casing protecting the underground sources of drinking water (USDWs) is prohibited.

Formation Logging and Testing. (Condition 3)

The tubing/casing annulus will be mechanical integrity tested prior to commencing injection. The Uinta and Upper Green River (TGR-1) Formations pore pressures must be determined, and uncontaminated (swab) samples of the injection formations waters must be obtained for analyses before authorization to inject will be granted. EPA has assumed the 0.65 psi/ft generic fracture gradient as applicable for the Uinta and Upper Green River (TGR-1) Formations because no documented value was submitted. The operator is required to conduct and submit a report on his Step Rate Test within six (6) months of authorization to inject to identify the injection zone fracture pressure; he may then request an increased injection pressure authorization. No additional formation logging or testing will be required prior to authorization to inject.

Monitoring Devices. (Condition 4)

In order to allow a representative of EPA to inspect the well and take injection pressure measurements, the Agency is requiring the operator to install at the time of well conversion and maintain in good operating condition all monitoring equipment. Included are: a) An injection fluid sampling tap on the discharge line between the injection pump and the wellhead; b) appropriate fittings, isolated by plug or globe valves, for the attachment of either permanent one-half (1/2) inch MIP gauges, or equivalent "quick-disconnect" gauges on the injection tubing for injection pressure measurement and on the tubing/casing annulus for indicating potential mechanical integrity problems; and c) a non-resettable flow meter for injection rate and cumulative volume measurements.

Section B - CORRECTIVE ACTION

There are no wells located within the one-quarter-mile-radius Area Of Review (AOR) of the proposed Altamont TEW #1-9B5 injection well which have penetrated the proposed injection intervals.

Therefore, the permittee will not be required to take corrective action on any wells within the one-quarter-mile-radius AOR because there are none.

Section C - WELL OPERATION

Prior to Commencing Injection. (Condition 1)

As-built and rework construction details have been submitted and verify adequate well construction (included in Appendix A) for the protection of underground sources of drinking water (USDW) prior to injection service.

Mechanical Integrity. (Condition 2)

The Natural Duck #2-15 GR injection well must pass a witnessed tubing/casing annulus mechanical integrity test conducted at a pressure of at least 300 psig, for the purpose of demonstrating integrity of the casing, tubing, and packer prior to commencing injection.

Demonstrations of mechanical integrity of the injection casing, tubing and packer will also be conducted within 30 days after any workovers/alterations (any unseating of packer) and prior to recommencing injection.

Injection Intervals. (Condition 3)

Produced water disposal injection will be limited to the combined injection zone intervals of the Uinta Formation (3,700-5,800') and the Upper Green River (TGR-1) Formation (5,900-6,400'). The upper confining zone is comprised of thick (over 800 feet), impermeable sections of the Uinta (Eocene Age) Shale with thin interbedded, dense siltstones in the interval of 2,900-3,700'. The lower confining zone is comprised of a greater-than 300-foot sequence of impermeable, vari-colored bentonitic shales interbedded with thin, dirty siltstone stringers (6,400-6,780') which lie immediately below the Upper Green River (TGR-1) Sand Formation. The proposed injection interval of the combined Uinta and Green River (TGR-1) Sand Formations is, therefore, adequately isolated (both above and below) from other permeable intervals, none of which are USDWs (See Technical Publication No. 92, State of Utah). Further, approximate water salinity calculations, both in and above the proposed injection zones, indicated the absence of USDWs (TDS greater than 10,000 mg/liter).

Injection Pressure Limitation.

(Condition 4)

The applicant requested a maximum surface injection pressure of 1,100 psig. A permitted surface injection pressure of 790 psig corresponds to EPA calculated formation fracture pressure gradient of approximately 0.65 psi/ft; this is considered a reasonable value for the Uinta/Green River Sand Formation intervals until such time the formation fracture pressure is determined with a Step-Rate Injectivity Test (to be performed within six (6) months of authorization to inject). A surface injection pressure greater than the permitted 790 psig will be permitted only after further demonstration that such injection pressure will not exceed the fracture pressure of the Uinta/Green River (TGR-1) Sand Formation injection intervals. The permitted 790 psig maximum allowable injection pressure is considered adequate to protect any possible USDWs.

Assumed: Sand-face Frac Grad = 0.65 psi/ft

$$\begin{aligned} \text{Psf} &= (\text{Frac Grad}) (d) = (0.65) (3700) \\ \text{Psf} &= 2405 \text{ psig} \end{aligned}$$

Calculate: Pmax (surface) using injection fluid
Sgw = 1.009 (@ 8900 mg/l TDS)

$$\begin{aligned} \text{Pmax} &= \text{Psf} - \text{Phd} = 2405 - (d) (.433) (\text{Sgw}) \\ &= 2405 - (3700) (.433) (1.009) = 2405 - 1615 \\ \text{Pmax} &= \underline{790 \text{ psig}} \quad (\text{at the surface}) \end{aligned}$$

Calculate: Sand Face Fracture Gradient using
Pmax = 1100 psig (operator proposed)

$$\begin{aligned} \text{Frac. Grad.} &= [(\text{Pmax} + \text{Phd})] + d \\ &= [1100 + (3700) (1.009)] + 3700 \\ &= [1100 + 3733] + 3700 \\ &= 4833 + 3700 = 0.765 \\ \text{Frac. Grad.} &= \underline{0.765 \text{ psi/ft}} \end{aligned}$$

Where: Pmax = maximum injection pressure at wellhead, psig
Sgw = 1.009, specific gravity of injected water
d = injection depth, feet
0.433 = fresh water pressure gradient, psi/ft

Injection Volume (Rate) Limitation.

(Condition 5)

The permit requires no limitation of the volume rate nor total cumulative volume of fluid injection into the Uinta and Green River Sand Formations in this well because the injection zones capacity is essentially unlimited and because no USDWs are present.

Section D - MONITORING, RECORDKEEPING & REPORTING OF RESULTS

Injection Well Monitoring Program. (Condition 1[a])

The permittee is required to analyze and report the water quality of injected fluids at annual intervals. The periodic water samples of injected fluids shall be analyzed for Total Dissolved Solids (TDS), major ions, pH, Specific Conductivity, and Specific Gravity, as will those when the source of injection fluid changes.

Section E - PLUGGING AND ABANDONMENT

Plugging & Abandonment Plan. (Condition 2)

The Plugging and Abandonment Plan submitted for the proposed injection well by the applicant as part of the permit application has been reviewed and is considered to adequately protect any USDWs, if present. This Plan is incorporated into the permit, and shall be binding on the permittee.

The Plugging and Abandonment Plan using Class "G" cement with 2% bentonite is as follows:

1. PLUG #1 - A 2800-foot, 500-sack Plug #1 (3,600-6,400') will be squeezed through a cement retainer set at 3,600' to completely cover the 3,700-6,400' perforated intervals, and fill the long string below the cement retainer; the excess tubing cement will be dumped above the cement retainer. This Plug #1 will be set inside the 7" 29# casing.
2. Plug #2 - A 200 foot, 30-sack Plug #2 (0-200') will be set at the surface inside the 7" 29# long string casing to the surface; the 7"-9 5/8" annulus was previously circulated to surface.
3. A "dry-hole" marker will be cemented inside the 7" long string casing at the surface.

Section F - FINANCIAL RESPONSIBILITY

1. Demonstration of Financial Responsibility. The permittee is required to maintain financial responsibility and resources to close, plug and abandon the injection well as provided in the plugging and abandonment plan.

(a) The permittee has submitted an acceptable \$10,000 Surety Performance Bond #U605243-56, United Pacific Insurance Company, Philadelphia, Pennsylvania, together with a companion Standby Trust Agreement, Texas Commerce Bank (N.A.) Houston, Texas, Trustee, which demonstrate the permittee's financial responsibility for plugging and abandonment requirements. It is dedicated to the Plugging and Abandonment of the Altamont TEW #1-9B5 well in the event of operator default and has been submitted by the permittee, Coastal Oil & Gas Corporation. This surety provides adequate financial resources, as determined by EPA to close (P&A) this injection well in accordance with the approved P&A Plan. This will serve as a demonstration of financial responsibility for the plugging and abandonment of this permitted injection well, has been incorporated into the permit, and shall be binding on the permittee. The permittee estimated that plugging and abandonment (including third party) costs for the Altamont TEW #1-9B5 injection well will be approximately \$10,000.

PART I. AUTHORIZATION TO CONSTRUCT AND INJECT

Pursuant to the Underground Injection Control (UIC) Regulations of the U.S. Environmental Protection Agency (EPA) codified at Title 40 of the Code of Federal Regulations, Parts 124, 144, 146, and 147,

Coastal Oil & Gas Corporation
600 17th Street, Suite 800-S
Denver, Colorado 80202

is hereby authorized to re-enter and convert the plugged and abandoned (PA) well TEW #1-9B5 to a UIC Class IID salt water disposal well. The TEW #1-9B5 proposed injection well is located 2334 feet from the North Line and 1201 feet from the East Line (SE/4 NE/4) Section 9, Township 2 South, Range 5 West in the Altamont-Bluebell Field, Duchesne County, Utah. Injection shall be for the purpose of disposing of produced Green River and Wasatch Formations water within the Altamont-Bluebell Field, in accordance with conditions set forth herein. Disposal injection will be into the combined injection zone intervals of the Uinta Formation (3,700-5,800') and the Upper Green River (TGR-1) Formation (5,900-6,400'). If not converted within one (1) year from the effective date of this permit, the proposed injection well shall be plugged and abandoned according to Permit Condition II.A.6.

Injection activities for this proposed injection well shall not commence until the operator has fulfilled all applicable conditions of this permit and has received written authorization from the Director. "Prior to Commencing Injection" requirements are set forth in Part II, Section C.1. of this permit.

All conditions set forth herein refer to Title 40 Parts 124, 144, 146, and 147 of the Code of Federal Regulations (CFR) and are regulations that are in effect on the date that this permit becomes effective.

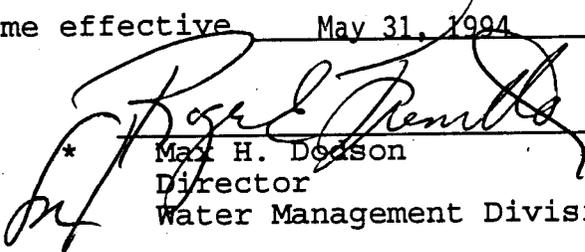

This permit consists of a total of thirty-three (33) pages and includes all items listed in the Table of Contents. Further, it is based upon representations made by the permittee and on other information contained in the administrative record.

This permit and the authorization to inject are being issued for the operating life of the well, unless terminated (Part III, Section B); authorization to inject shall automatically expire due to prolonged postponement of conversion/construction (Part II, Section A.6.). The permit will be reviewed by EPA at least every five (5) years to determine whether action under 40 CFR §144.36 (a) is warranted.

The State of Utah or the Northern Ute Indian Tribe of the Uintah-Ouray Reservation may apply for primary enforcement responsibility for the UIC program, thereby assuming primary responsibility for regulating this permittee. Notwithstanding approval of the State or Tribal UIC primacy application, EPA retains responsibility for directly administering and enforcing this Federal permit, unless otherwise specifically addressed in the EPA/State or EPA/Tribe Memorandum of Agreement (40 CFR § 145.25). If EPA determines that the State or Tribe has issued an equivalent permit under an EPA approved UIC program, EPA and the permittee may agree to terminate this Federal permit.

Issued this 31st day of May, 1994.

This permit shall become effective May 31, 1994.

* Max H. Deason
Director
Water Management Division

* NOTE: The person holding this title is referred to as the "Director" throughout this permit.

PART II. SPECIFIC PERMIT CONDITIONS

A. WELL CONSTRUCTION/CONVERSION REQUIREMENTS

1. Casing and Cementing. The conversion details submitted with the permit application are hereby incorporated into this permit as Appendix A, and shall be binding on the permittee. The casing strings-cement programs for the "as-is" well construction are as follows (assuming the use of Class "B" cement throughout):

- (a) The 13 3/8-inch, 68-pound per foot surface casing was cemented to surface in 17 1/2-inch hole from 351' Kelly Bushing (KB) with 700 sacks of Class "B" cement.
- (b) The 9 5/8-inch, 40-pound per foot intermediate string casing was cemented in 12 1/4-inch hole from a depth of 5,841' KB to a calculated TOC at 2,074' with 1300 sacks of Class "B" cement. The 9 5/8-inch, 40 pound per foot intermediate string was then perforated at a depth of 1,565' and squeezed to surface with 1200 sacks Class B cement.
- (c) The 7-inch, 29-pound per foot production (long string) casing was cemented in 8 3/4-inch hole from total depth (TD) at 11,999' KB to the top of cement (TOC) at approximately 9,961' KB with a total of 400 sacks of Class "B" cement. The 7-inch casing was perforated at 6,004' and 850 sacks Class "G" Hy-Fill cement were squeezed in open hole to the intermediate string shoe at 5,841', and inside the 9 5/8-inch 40-pound per foot intermediate casing string to approximately 200' from the surface after numerous attempts. The 7" - 9-5/8" annulus was then filled with cement pumped from the surface.
- (d) The 5-inch, 18-pound per foot liner (casing) was hung in the 7-inch long string casing and in the 6 1/8-inch hole drilled to a Total Depth (TD) of 15,337'. The liner was cemented from the liner hanger (at 11,716') to TD with a total of 701 sacks Class "B" cement; the plugged back total depth (PBD) is 15,072'.

All cement in the prior construction of the well was designed for the life expectancy of the well. The Plugged and Abandoned (P&A) existing dry hole well is proposed to be re-entered and constructed to injection service with appropriate minor changes in the existing construction. The 0-260' surface plug inside the 7-inch production casing, and the 5,500-5,900 plug across the intermediate casing shoe will be drilled out in the well conversion construction. The existing 7-inch retainer at 10,000' with the 440', 70 sack-cement cover plug will remain in-place undisturbed, as will the 5-inch bridge plug at 13,480' with 200 sacks of cement on

top. These plugs will isolate the original, deep completion perforations.

The specific injection interval and construction modifications will be identified on the Well Completion Report (EPA Form 7520-10).

The proposed Conversion Completion Procedure for the existing Plugged and Abandoned dry hole is included in Appendix A. The Uinta Sand Formation at 3,700-5,800' and the Upper Green River Sand (TGR 1) Formation at 5,900-6,400' zones will be perforated for water disposal injection service.

2. Tubing and Packer Specifications. A tubing of two and seven-eighths (2 7/8)-inch diameter injection will be utilized with an appropriate packer set at the proposed depth of approximately 3,600' KB inside the 7-inch long string casing. The permittee is required to set the packer at a distance of no more than 100 feet above the 3,700-foot top injection perforation. The casing/tubing annulus will be filled with corrosion-inhibited fresh water. Injection between the wellbore and the outermost casing protecting the underground sources of drinking water (USDWs) is prohibited.

3. Monitoring Devices. The operator shall provide at the time of well conversion and maintain in good operating condition:

- (a) A tap on the discharge line between the injection pump and the wellhead for the purpose of obtaining representative samples of the injection fluids;
- (b) Two (2), one-half (1/2) inch Female Iron Pipe (FIP) fittings, isolated by plug or globe valves, and located: 1) at the wellhead on the tubing; and 2) on the tubing/casing annulus; and
- (c) pressure gauges (or "quick-disconnect" gauge fittings) attached to the FIP fittings on: 1) the tubing/casing annulus to allow for monitoring of the annulus fluid pressure; and 2) the tubing to allow for injection pressure monitoring. The gauges shall be designed to operate at a certified accuracy of ninety-five (95) percent, throughout the range of anticipated injection pressures; and
- (d) A flow meter with cumulative volume recorder that is certified for at least ninety-five (95) percent accuracy, throughout the range of injection rates allowed by the permit.

4. Proposed Changes and Workovers. The permittee shall give advance notice to the Director, as soon as possible, of any planned physical alterations or additions to the permitted well. Major

alterations or workovers of the permitted well shall meet all conditions as set forth in this permit. A major alteration/workover shall be considered any work performed, which affects casing, packer(s), or tubing.

Demonstration of mechanical integrity shall be performed within thirty (30) days of completion of workovers/alterations and prior to resuming injection activities, in accordance with Part II, Section C.2.(a).

The permittee shall provide all records of well workovers, logging, or other test data to EPA within sixty (60) days of the completion of the activity. Appendix B contains samples of the appropriate reporting forms.

5. Formation Testing. When the proposed injection zone(s) are perforated, the well will be swabbed and uncontaminated, representative water samples will be taken from each of the two proposed injection zones. The permittee is required to determine the injection zone fluid pore pressure (static bottom hole pressure). For the purpose of identifying the current formation fracture pressure, an appropriate and documented step-rate injectivity test will be performed by the permittee in the proposed injection zone(s) when stabilized injection rate conditions have been attained and using fluids normally being injected. This step-rate test will be run within six (6) months of the initial date of authorization to inject.

6. Postponement of Conversion. If the well is not constructed for injection service within one (1) year from the effective date of this permit, the permit will automatically expire, unless the permittee requests an extension. A written request shall be made to the Director, in lieu of the annual reporting requirements of Part II, Section D. 4., and shall state the reasons for the delay in conversion and confirm the protection of all USDWs. Such an extension may not exceed one (1) year.

Financial responsibility shall be maintained during the period of inactivity in accordance with Part II, Section F. Once a permit expires under this part, the full permitting process, including opportunity for public comment, must be repeated before authorization to inject will be re-issued.

B. CORRECTIVE ACTION

The applicant submitted the required one-quarter mile radius Area Of Review (AOR) information with the permit application. No wells are located within the AOR of the TFW #1-9B5 proposed injection well; therefore, no USDWs will be endangered and no corrective action is required.

C. WELL OPERATION

1. Prior to Commencing Injection. Injection operations may not commence until the permittee has complied with (a) and (b) as follows:

- (a) **Conversion construction is complete** (according to the requirements in Part II. Sections A & B) and the permittee has submitted a **Well Rework Record, Form 7520-12** (in Appendix B); and
 - (i) The Director has inspected or otherwise reviewed the newly converted injection well and finds it is in compliance with the conditions of the permit; or
 - (ii) The permittee has not received notice from the Director of his or her intent to inspect or otherwise review the new injection well **within thirteen (13) days** of the date the Director receives the Well Rework Record in paragraph (a) of this permit condition in which case prior inspection or review is waived and the permittee may commence injection. [Note: However, in all circumstances, item (b) below must also be satisfied.]
- (b) The permittee has:
 - (i) **completed Formation Testing** requirements (Part II, Section A. 5.);
 - (ii) **demonstrated that the well has mechanical integrity (MI)** in accordance with 40 CFR §146.8 and Part II, Section C. 2. below;
 - (iii) **submitted a Cement Bond Log**, which identifies adequate bonding above the 1660 foot squeezed zone; and
 - (iv) **received written notice from the Director that such demonstrations are satisfactory.**

2. Mechanical Integrity Demonstration.

- (a) Method of Demonstrating Mechanical Integrity. A demonstration of the absence of significant leaks in the casing, tubing and/or packer must be made by performing a **tubing/casing annulus pressure test**. This test shall be for a **minimum of 45 minutes** at: (1) a pressure of **300 pounds per square inch gauge (psig)** measured at the surface, if the well is **shut-in**; or (2) a pressure

C. WELL OPERATION

1. Prior to Commencing Injection. Injection operations may not commence until the permittee has complied with (a) and (b) as follows:

- (a) **Conversion construction is complete** (according to the requirements in Part II, Sections A & B) and the permittee has submitted a **Well Rework Record, Form 7520-12** (in Appendix B); and
 - (i) The Director has inspected or otherwise reviewed the newly converted injection well and finds it is in compliance with the conditions of the permit; or
 - (ii) The permittee has not received notice from the Director of his or her intent to inspect or otherwise review the new injection well **within thirteen (13) days** of the date the Director receives the Well Rework Record in paragraph (a) of this permit condition in which case prior inspection or review is waived and the permittee may commence injection. [Note: However, in all circumstances, item (b) below must also be satisfied.]
- (b) The permittee has:
 - (i) **completed Formation Testing** requirements (Part II, Section A. 5.);
 - (ii) **demonstrated that the well has mechanical integrity (MI)** in accordance with 40 CFR §146.8 and Part II, Section C. 2. below;
 - (iii) **submitted a Cement Bond Log**, which identifies adequate bonding above the 1660 foot squeezed zone; and
 - (iv) **received written notice from the Director that such demonstrations are satisfactory.**

2. Mechanical Integrity Demonstration.

- (a) Method of Demonstrating Mechanical Integrity. A demonstration of the absence of significant leaks in the casing, tubing and/or packer must be made by performing a **tubing/casing annulus pressure test**. This test shall be for a **minimum of 45 minutes** at: (1) a pressure of **300 pounds per square inch gauge (psig)** measured at the surface, if the well is **shut-in**; or (2) a pressure

if injection activities are continued during the test. The tubing/casing annulus shall be filled with a non-corrosive fluid (either a non-toxic liquid or the injection liquid) at least 24 hours in advance of the test. Pressure values shall be recorded at five (5) minute intervals. A well passes the mechanical integrity test if there is less than a ten (10) percent decrease (or increase) in pressure over the forty-five (45) minute period.

(b) Schedule for Demonstrations of Mechanical Integrity. A demonstration of mechanical integrity shall be made at regular intervals, no less frequently than every five (5) years from the effective date of this permit, in accordance with 40 CFR §146.8 and paragraph (a) above, unless otherwise modified. Initiation of mechanical integrity demonstrations will be according to the following provisions:

(i) It shall be the permittee's responsibility to arrange and conduct the routine five-year demonstrations. The permittee shall notify the Director of his intent to demonstrate mechanical integrity at least thirty (30) days prior to each such demonstration. Results of the test shall be submitted to the Director as soon as possible but no later than sixty (60) days after the demonstration.

(ii) In addition to any demonstration made under paragraph (i) above, the Director may require a demonstration of mechanical integrity at any time during the permitted life of the well.

(c) Loss of Mechanical Integrity. If the well fails to demonstrate mechanical integrity during a test, or a loss of mechanical integrity as defined by 40 CFR §146.8 becomes evident during operation, the permittee shall notify the Director in accordance with Part III, Section E. 10. of this permit. Furthermore, injection activities shall be terminated immediately; and operation shall not be resumed until the permittee has taken necessary actions to restore integrity to the well and EPA gives approval to recommence injection.

3. Injection Intervals. As identified in Appendix A, produced brine injection shall be limited to the gross subsurface Uinta and Upper Green River (TGR-1) Formations intervals, (at approximately 3,700-5,800' and 5,900-6,400' KB). Additional injection perforations within the gross intervals, may be added

later and shall be reported on EPA Form 7520-12; swab-test uncontaminated fluid samples of the newly perforated Uinta Sand and/or Green River Sand gross intervals must be separately taken, analyzed, and reported.

4. Injection Pressure Limitation.

- (a) Injection pressure, measured at the surface, shall not exceed 790 psig, an amount that the Director has determined as appropriate to ensure that injection does not initiate new fractures or propagate existing fractures in the confining zones adjacent to the upper-most injection zone.
- (b) The pressure limit in paragraph (a) may be increased and/or decreased by the Director if the permittee demonstrates that the proposed increase in surface injection pressure will not exceed the fracture pressure of the injection zone. This demonstration shall be made by performing a step-rate injection test, using fluid normally injected, to determine both the instantaneous shut-in pressure (ISIP) and the formation breakdown pressure. The Director will determine any allowable increase based upon the step-rate test results and other parameters reflecting actual injection operations.
- (c) The permittee shall give thirty (30) days advance notice to the Director if the increase in paragraph (b) will be sought. Details of the proposed test shall be submitted at least seven (7) days in advance of the proposed test date so that the Director has adequate time to review and approve the test procedures. Results of all tests shall be submitted to the Director within ten (10) days of the test. Injection at the increased pressure must be approved by the Director, in writing, before the permittee may begin continuous operation at that pressure.
- (d) Any approval granted by the Director for the increased pressure limitations as stated in paragraph (b) shall be made a part of this permit by minor permit modification without further opportunity for public comment.

5. Injection Volume (Rate) Limitation. There is no limitation on the number of barrels of water per day (BWPD) that shall be injected in this well, provided further that in no case shall injection pressure exceed that limit shown in Part II, Section C.4. (a) of this permit.

6. Injection Fluid Limitation. The permittee shall not inject any hazardous substances, as defined by 40 CFR Part 261, at any time during the operation of the facility; and further, no substances other than those produced brines from oil and/or gas production in the Altamont/Bluebell Field. However, additional injection fluids will be limited to occasional minor amounts of well treatment fluids, such as diluted and spent acids, corrosion inhibiting fluids, etc., as related to oil and/or gas production from the Green River and Wasatch Formations in the Altamont/Bluebell Field area. The source and composition of any fluids other than those explicitly allowed by this permit must be reported to the Director within thirty (30) days of any change in injection fluids.

7. Annular Fluid. The annulus between the tubing and the casing shall be filled with fresh water treated with a corrosion inhibiting, oxygen scavenging solution, or other industry-acceptable solution as approved, in writing, by the Director.

D. MONITORING, RECORDKEEPING, AND REPORTING OF RESULTS

1. Injection Well Monitoring Program. Samples and measurements shall be representative of the monitored activity. The permittee shall utilize the applicable analytical methods described in Table I of 40 CFR §136.3, or in Appendix III of 40 CFR Part 261, or in certain circumstances, by other methods that have been approved by the EPA Administrator. Monitoring shall consist of:

- (a) Analysis of the injection fluids, performed:
 - (i) annually for Total Dissolved Solids, major ions, pH, Specific Conductivity, and Specific Gravity; and,
 - (ii) whenever there is a change in the source of injection fluids.
- (b) Monthly observations of injection pressure, tubing/ casing annulus pressure, fluid injection (flow) rate and cumulative injected volume. At least one observation of injection pressure, tubing/casing annulus pressure, fluid injection (flow) rate, and cumulative volume, shall be recorded at regular intervals no greater than thirty (30) days.

2. Monitoring Information. Records of any monitoring activity required under this permit shall include:

- (a) The date, exact place, the time of sampling or field measurements;
- (b) The name of the individual(s) who performed the sampling or measurements;
- (c) The exact sampling method(s) used to take samples;
- (d) The date(s) laboratory analyses were performed;
- (e) The name of the individual(s) who performed the analyses;
- (f) The results of such analyses.

3. Recordkeeping.

- (a) The permittee shall retain records concerning:
 - (i) the nature and composition of all injected

fluids until three (3) years after the completion of plugging and abandonment which has been carried out in accordance with the Plugging and Abandonment Plan shown in Appendix C, and is consistent with 40 CFR § 146.10.

- (ii) all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation and copies of all reports required by this permit for a period of at least five (5) years from the date of the sample, measurement or report throughout the operating life of the well.
- (b) The permittee shall continue to retain such records after the retention period specified in paragraphs (a) (i) and (a) (ii) unless he delivers the records to the Director or obtains written approval from the Director to discard the records.
- (c) The permittee shall maintain copies (or originals) of all pertinent monthly recorded information [Part II., Section D.1.(b)] available for inspection at the lease facility.

4. Reporting of Results. The permittee shall submit an Annual Report, whether injecting or not, to the Director summarizing the results of the monitoring required by Part II, Section D. 1. of this permit. Copies of all monthly records on injected fluids, and any major changes in characteristics or sources of injected fluid shall be included in the Annual Report. The first Annual Report shall cover the period from the effective date of the permit through December 31. Annual Reports shall cover the period of January 1 through December 31, and shall be submitted by February 15 of the following year. Appendix B contains Form 7520-11 which may be copied and used to submit the Annual Report.

E. PLUGGING AND ABANDONMENT

1. Notice of Plugging and Abandonment. The permittee shall notify the Director forty-five (45) days before abandonment of the well.

2. Plugging and Abandonment Plan. The permittee shall plug and abandon the well as provided in the Plugging and Abandonment Plan, Appendix C. EPA reserves the right to change the manner in which the well will be plugged if the well is modified during its

permitted life or if the well is not made consistent with EPA requirements for construction and mechanical integrity. The Director may request the permittee to estimate and to update the estimated plugging cost periodically. Such estimates shall be based upon costs which a third party would incur to plug the well according to the plan.

3. Cessation of Injection Activities. After a cessation of operations of two (2) years (temporary abandonment), the permittee shall plug and abandon the well in accordance with the Plugging & Abandonment Plan, unless he:

- (a) has provided written notice to the Director, and
- (b) has demonstrated that the well will be used in the future, and
- (c) has described actions or procedures, satisfactory to the Director, that will be taken to ensure that the well will not endanger underground sources of drinking water during the period of temporary abandonment.

4. Plugging and Abandonment Report. Within sixty (60) days after plugging the well, the permittee shall submit a report on Form 7520-13 to the Director. The report shall be certified as accurate by the person who performed the plugging operation and the report shall consist of either: (1) a statement that the well was plugged in accordance with the plan, or (2) where actual plugging differed from the plan, a statement specifying the different procedures followed.

F. FINANCIAL RESPONSIBILITY

1. Demonstration of Financial Responsibility. The permittee is required to maintain financial responsibility and resources to close, plug and abandon the injection well as provided in the plugging and abandonment plan. The permittee may, upon his own initiative and upon written request to EPA, change the method of demonstrating financial responsibility. A change in demonstration of financial responsibility must be approved in writing by the Director.

PART III. GENERAL PERMIT CONDITIONS

A. EFFECT OF PERMIT

The permittee is allowed to engage in underground injection in accordance with the conditions of this permit. The permittee, as authorized by this permit, shall not construct, operate, maintain, convert, plug, abandon, or conduct any other injection activity in a manner that allows the movement of fluid containing any contaminant into underground sources of drinking water, if the presence of that contaminant may cause a violation of any primary drinking water regulation under 40 CFR Part 142 or otherwise adversely affect the health of persons. Any underground injection activity not authorized in this permit or otherwise authorized by permit or rule is prohibited. Issuance of this permit does not convey property rights of any sort or any exclusive privilege; nor does it authorize any injury to persons or property, any invasion of other private rights, or any infringement of State or local laws or regulations. Compliance with the terms of this permit does not constitute a defense to any enforcement action brought under the provisions of Section 1431 of the Safe Drinking Water Act (SDWA), 42 USC Part 300i, or any other law governing protection of public health or the environment for any imminent and substantial endangerment to human health or the environment, nor does it serve as a shield to the permittee's independent obligation to comply with all UIC regulations.

B. PERMIT ACTIONS

1. Modification, Reissuance, or Termination. The Director may, for cause or upon request from the permittee, modify, revoke and reissue, or terminate this permit in accordance with 40 CFR §§124.5, 144.12, 144.39, and 144.40. Also, the permit is subject to minor modifications for cause as specified in 40 CFR §144.41. The filing of a request for a permit modification, revocation and reissuance, or termination or the notification of planned changes or anticipated noncompliance on the part of the permittee does not stay the applicability or enforceability of any permit condition.

2. Conversions. The Director may, for cause or upon a request from the permittee, allow conversion of the well from a Class II injection well to a non-Class II well. Requests to convert the injection well from its Class II status to a non-Class II well, such as a production well, must be made in writing to the Director. Conversion may not proceed until a permit modification indicating the conditions of the proposed conversion is received by the permittee. Conditions of the modification may include such items as, but is not limited to, approval of the proposed well rework, follow-up demonstration of mechanical integrity, and well-specific monitoring and reporting following the conversion.

3. Transfers. This permit is not transferrable to any person except after notice is provided to the Director and the requirements of 40 CFR §144.38 are complied with. The Director may require modification, or revocation and reissuance, of the permit to change the name of the permittee and incorporate such other requirements as may be necessary under the SDWA.

C. SEVERABILITY

If any provision of this permit or the application of any provision of this permit to any circumstance is stayed or held invalid, all remaining provisions of this permit shall remain fully effective and enforceable, except for those provisions which are not severable from the stayed or invalid provision.

D. CONFIDENTIALITY

In accordance with 40 CFR Part 2 and 40 CFR §144.5, any information submitted to EPA pursuant to this permit may be claimed as confidential by the submitter. Any such claim must be asserted at the time of submission by stamping the words "confidential business information" on each page containing such information. If no claim is made at the time of submission, EPA may make the information available to the public without further notice. If a claim is asserted, the validity of the claim will be assessed in accordance with the procedures in 40 CFR Part 2 (Public Information). EPA will deny any claim of confidentiality including but not limited to the following information:

- The name and address of the permittee, and
- Information which deals with the existence, absence, or level of contaminants in drinking water.

E. GENERAL DUTIES AND REQUIREMENTS

1. Duty to Comply. The permittee shall comply with all conditions of this permit, except to the extent and for the duration such noncompliance is authorized by an emergency permit. Any permit noncompliance constitutes a violation of the SDWA and is grounds for enforcement action, permit termination, revocation and reissuance, or modification. Such non-compliance may also be grounds for enforcement action under the Resource Conservation and Recovery Act (RCRA).

2. Penalties for Violations of Permit Conditions. Any person who violates a permit requirement is subject to civil penalties, fines, and other enforcement action under the SDWA and may be subject to such actions pursuant to the RCRA. Any person who willfully violates permit conditions may be subject to criminal prosecution.

3. Need to Halt or Reduce Activity not a Defense. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

4. Duty to Mitigate. The permittee shall take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this permit.

5. Proper Operation and Maintenance. The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems only when necessary to achieve compliance with the conditions of this permit.

6. Duty to Provide Information. The permittee shall furnish the Director, within a time specified, any information which the Director may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit, or to determine compliance with this permit. The permittee shall also furnish to the Director, upon request, copies of records required to be kept by this permit.

7. Inspection and Entry. The permittee shall allow the Director, or an authorized representative, upon the presentation of credentials and other documents as may be required by law, to:

- (a) Enter upon the permittee's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this permit;
- (b) Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit;
- (c) Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; and
- (d) Sample or monitor, at reasonable times, for the purposes of assuring permit compliance or as otherwise authorized by the SDWA any substances or parameters at any location.

8. Records of the Permit Application. The permittee shall maintain records of all data required to complete the permit application and any supplemental information submitted for a period of five (5) years from the effective date of this permit. This period may be extended by request of the Director at any time.

9. Signatory Requirements. All reports or other information requested by the Director shall be signed and certified according to 40 CFR §144.32.

10. Reporting of Noncompliance.

(a) Anticipated Noncompliance. The permittee shall give advance notice to the Director of any planned changes in the permitted facility or activity which may result in noncompliance with permit requirements.

(b) Compliance Schedules. Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit shall be submitted no later than thirty (30) days following each schedule date.

(c) Twenty-four Hour Reporting.

(i) The permittee shall report to the Director any noncompliance which may endanger health or the environment. Information shall be provided orally within twenty-four (24) hours from the time the permittee becomes aware of the circumstances by telephoning EPA at (303) 293-1413 (during normal business hours) or at (303) 293-1788 (for reporting at all other times). The following information shall be included in the verbal report:

(A) Any monitoring or other information which indicates that any contaminant may cause endangerment to an underground source of drinking water.

(B) Any noncompliance with a permit condition or malfunction of the injection system which may cause fluid migration into or between underground sources of drinking water.

(ii) A written submission shall also be provided to the Director within five (5) days of the time the permittee becomes aware of the potential for endangerment to health or environment. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times,

and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance.

- (d) Other Noncompliance. The permittee shall report all other instances of noncompliance not otherwise reported at the time monitoring reports are submitted. The reports shall contain the information listed in Part III, Section E. 10. (C) (ii) of this permit.
- (e) Other Information. Where the permittee becomes aware that he failed to submit any relevant facts in the permit application, or submitted incorrect information in a permit application or in any report to the Director, the permittee shall submit such facts or information within two (2) weeks of the time such information became known to him.

APPENDIX A - CONSTRUCTION PROCEDURES

PLUGGING AND ABANDONMENT PLAN, NARRATIVE

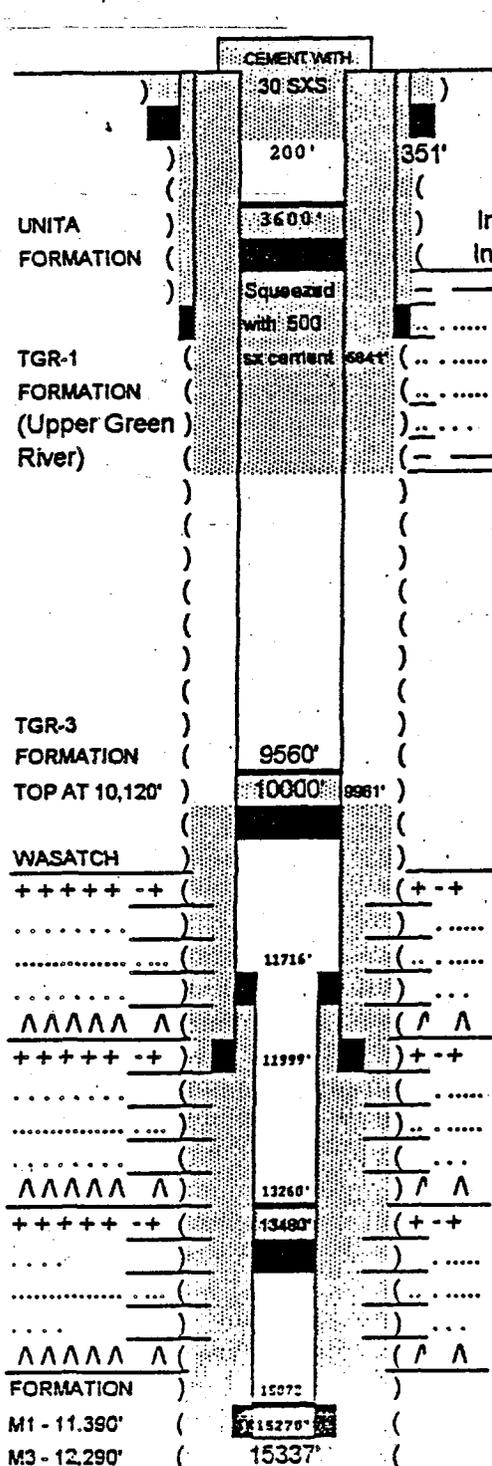

The Plugging and Abandonment Plan submitted for the proposed injection well by the applicant as part of the permit application has been reviewed and is considered to adequately protect the underground sources of drinking water (USDW).

The Plugging and Abandonment Plan using Class "G" cement with 2% bentonite is as follows:

1. PLUG #1 - A 2800-foot, 500-sack Plug #1 (3,600-6,400') will be squeezed through a cement retainer set at 3,600' to completely cover the 3,700-6,400' perforated intervals, and fill the long string below the cement retainer; the excess tubing cement will be dumped above the cement retainer. This Plug #1 will be set inside the 7" 29# casing.
2. Plug #2 - A 200 foot, 30-sack Plug #2 (0-200') will be set at the surface inside the 7" 29#" long string casing to the surface; the 7"-9 5/8" annulus was previously circulated to surface.
3. A "dry-hole" marker will be cemented inside the 7" long string casing at the surface.

PROPOSED CASING AND CEMENTING PROGRAM

Size of Hole	Size of Casing	Weight per Foot	Setting Depth	Quantity of Cement
17 1/2"	13-3/8"	68#	351'	700 sx
12 1/4"	9-5/8"	40#	5841'	1300 sx
8-3/4"	7"	29#	11,999'	400 sx

Propose to re-enter the previously P&A'd Tew #1-9B5 (Operator ANR) and convert to SWD well. The well will be cleaned out to 9560' and the Uinta perf'd @ 3700'-5800' and Upper Green River (TGR1) perf'd @ 5900'-6400'. The well will be converted to injection to allow disposal of Wasatch/Lower Green River produced water from the Altamont/Bluebell Field. The EPA has granted approval for injection on June 3, 1994 (Permit #UT2722-03788).

IN ABOVE SPACE DESCRIBE PROPOSED PROGRAM: If proposal is to deepen or plug back, give data on present productive zone and proposed new productive zone. If proposal is to drill or deepen directionally, give pertinent data on subsurface locations and measured and true vertical depths. Give blowout preventer program, if any.

24. I hereby certify that this report is true and complete to the best of my knowledge.

API #43-013-30121

Dear Frank,

As per our telephone conversation of this morning, enclosed please find three copies of the A.P.D. on the subject well which were previously submitted on June 14, 1994.

Also enclosed, please find three copies of the re-entry procedure, wellbore diagrams and BOP Diagram which you requested.

As we discussed, ANR is anxious to begin this well as soon as possible, therefore, your early approval of this application would be greatly appreciated. If you should need additional information, please call Mr. Mark Ernest at 303/573-4454 or you can reach me at the number shown below.

Sincerely,

PERMITCO INC.

Present Status: Well P&A'd 1/18/90.

RECOMMENDED PROCEDURE

1. MIRU workover rig. (Note: Give State of Utah 24-hour notice prior to moving in.)
2. Dig out cellar. Weld on 7" 26-29# S-95 landing joint & horse collar to 9⁵/₈" csg. Install 7" 5000# csg head flange. NU 6" 5000# WP BOP's (7-1/16" bore).

- 3) RIH w/6" drag bit. Drill out surface plug @ surface to 200'. Pressure test 7" csg above 5500' to 2000#. Drill out cmt plug @ 5500-5940' (440'). RIH & CO 7" csg to PBD @ 9560'. Pressure test 7" csg to 2000#. If 7" csg leaks, consider Casing Inspection Log and squeeze as needed. POH w/bit.
- 4) Run a GR/CBL log from 9560' to surface w/2000# to determine cmt coverage.
- 5) From the CBL log, perf 7" csg & set a cmt retainer to isolate the proposed Upper Green River perms @ ±5900-6400'. Squeeze w/necessary cement as required.
- 6) Perf & set a cmt retainer to isolate the proposed Uinta perms @ ±3700-5800'. Squeeze with necessary cement as required. WOC.
- 7) PU 6" mill & drill out squeezes. Pressure test each to 2000# after drillout. Circulate & condition hole. POH.
- 8) Run a GR/CBL log across proposed zones of interest w/2000#. Re-squeeze as necessary.
- 9) Run a SDT/CNL/GR Digital Sonic log from 8000' to surface to determine proposed injection zones in well. (Note: No open hole logs were run above 5841' due to hole problems.)
- 10) RU wireline w/lubricator. Perforate the proposed Uinta selectively @ ±3700-5800' and the Upper Green River (TGR1) @ ±5900-6400' @ 4 SPF w/4" csg gun. Correlate to the SDT Sonic log.
- 11) RIH w/Mtn States retrievable pkr & bridge plug on 2 7/8" tbg. Isolate perforated intervals @ 3700-5800' and 5900-6400' and swab test separately for analysis of formation water as required by the State of Utah and BLM.
- 12) Set pkr above all zones @ ±3500'. Acidize Uinta & Upper Green River zones w/16,000 gal 15% HCl + rock salt & BAF (diverter) in 4 stages.
Note: A) All acid to contain inhibitor, friction reducer, iron sequestering agent and surfactant.
B) Pump at max possible rate (12-15 BPM), not to exceed 5000 psi.
C) Hold 2000 psi on csg during job.
- 13) POH w/pkr & RBP.
- 14) PU 3 1/2" "F" nipple (PC), 4' - 3 1/2" pup jt (PC), Mtn States Lok-set pkr (PC) w/on-off tool and 3 1/2" 9.3# J-55 8rd tbg (internal coated w/Duoline-20 fiberglass & Threadmaster MMS couplings, Burst 6980 psi, Collapse 7400 psi, Tension 142,000#, max temp 300°F). Pressure test tbg to 5000 psi. Circ treated, non-corrosive production water for pkr fluid. Set pkr @ ±200' above uppermost perf w/18-20,000# tension. Test annulus to 2000 psi.
- 15) Land tbg. ND BOP, NU injection WH. RDMO rig.

ICATION FOR INJECTION WELL - UIC FORM 1

OPERATOR COASTAL OIL & GAS CORPORATION
ADDRESS P.O. BOX 749
DENVER, CO 80201

Well name and number: TEW #1-9B5

Field or Unit name: ALTAMONT Lease no. _____

Well location: QQ SENE section 9 township 2S range 5W county DUCHESNE

Is this application for expansion of an existing project? . . Yes No

How will the proposed well be used for:
Enhanced Recovery? . . Yes No
Disposal? Yes No
Storage? Yes No

Is this application for a new well to be drilled? Yes No

Is this application for an existing well,
has a casing test been performed on the well? Yes No

Date of test: _____
API number: 43-013-30121

Proposed injection interval: from 3700' to 6400'

Proposed maximum injection: rate 15,000 BPD pressure 1100 psig

Does proposed injection zone contain oil, gas, and/or fresh water within 1/2
mile of the well.

IMPORTANT: Additional information as required by R615-5-2 should
accompany this form.

List of Attachments: EPA PERMIT

APPLICATION FOR PERMIT TO DRILL, DEEPEN, OR PLUG BACK

1. Type of Work: DRILL DEEPEN *Re-entry* PLUG BACK

2. Name of Operator: ANR Production Company

3. Address of Operator: P.O. Box 749, Denver, CO 80201-0749 (303) 573-4476

4. Location of Well (Report location clearly and in accordance with any State requirements.):
At surface: 2334' FNL & 1201' FEL (SE/NE)
At proposed prod. zone: Same

5. Lease Designation and Serial No.: Patented

6. If Indian, Allottee or Tribe Name: N/A

7. Unit Agreement Name:

8. Farm or Lease Name: Tew

9. Well No.: #1-9B5

10. Field and Pool, or Wildcat: Altamont

11. Qd. Sec., T., S., R., or Sth. and Survey or Area: Section 9-T2S-R5W

12. County or Parish: Duchesne | 13. State: UT

14. Distance in miles and direction from nearest town or post office*: Well located 11 miles WSW of Altamont, UT.

15. Distance from proposed location to nearest property or lease line, ft. (Also to nearest drlg. line, if any): 1201' FEL

16. No. of acres in lease: 480

17. No. of acres assigned to this well: 480

18. Distance from proposed location to nearest well, drilling, completed, or applied for, on this lease, ft.: N/A

19. Proposed depth: 9560'

20. Rotary or cable tools: Rotary

21. Elevations (Show whether DF, RT, GR, etc.): 7047' GL, 7073' KB

22. Approx. date work will start*:

PROPOSED CASING AND CEMENTING PROGRAM

Size of Hole	Size of Casing	Weight per Foot	Setting Depth	Quantity of Cement
17 1/2"	13-3/8"	68#	351'	700 sx
12 1/2"	9-5/8"	40#	5841'	1300 sx
8-3/4"	7"	29#	11,999'	400 sx

Propose to re-enter the previously P&A'd Tew #1-9B5 (Operator ANR) and convert to SWD well. The well will be cleaned out to 9560' and the Uinta perf'd @ 3700'-5800' and Upper Green River (TGR1) perf'd @ 5900'-6400'. The well will be converted to injection to allow disposal of Wasatch/Lower Green River produced water from the Altamont/Bluebell Field. ~~The EPA has granted approval for injection on June 3, 1994, (Permit #UT2722-03788).~~

IN ABOVE SPACE DESCRIBE PROPOSED PROGRAM: If proposal is to deepen or plug back, give data on present productive zone and proposed new productive zone. If proposal is to drill or deepen directionally, give pertinent data on subsurface locations and measured and true vertical depths. Give blowout preventer program, if any.

Re: Tew #1-9B5 Well, 2334' FNL, 1201' FEL, SE NE, Sec. 9, T. 2 S., R. 5 W.,
Duchesne County, Utah

Gentlemen:

Pursuant to Utah Admin. R. 649-3-3, Exception to Location and Siting of Wells and R. 649-3-4, Permitting of Wells to be Drilled, Deepened or Plugged-Back, approval to reenter and drill the referenced well is hereby granted.

In addition, the following specific actions are necessary to fully comply with this approval:

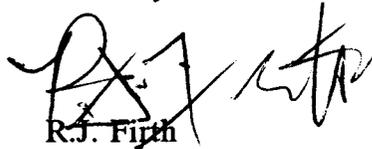

1. Compliance with the requirements of Utah Admin. R. 649-1 et seq., the Oil and Gas Conservation General Rules.
2. Notification to the Division within 24 hours after drilling operations commence.
3. Submittal of Entity Action Form, Form 6, within five working days following commencement of drilling operations and whenever a change in operations or interests necessitates an entity status change.
4. Submittal of the Report of Water Encountered During Drilling, Form 7.
5. Prompt notification prior to commencing operations, if necessary, to plug and abandon the well. Notify Frank R. Matthews, Petroleum Engineer, (Office) (801)538-5340, (Home) (801)476-8613, or K. Michael Hebertson, Reclamation Specialist, (Home) (801)269-9212.
6. Compliance with the requirements of Utah Admin. R. 649-3-20, Gas Flaring or Venting, if the well is completed for production.

Page 2
ANR Production Company
Tew #1-9B5 Well
June 23, 1994

This approval shall expire one year after date of issuance unless substantial and continuous operation is underway or a request for an extension is made prior to the approval expiration date. The API number assigned to this well is 43-013-30121.

Sincerely,

A handwritten signature in black ink, appearing to be 'R.J. Firth', written over a printed name.

=====

REMARKS:
RAN BOND LOG AND DIDN'T HAVE CEMENT. SET RETAINER AT 6330 FEET AND
WILL TRY TO OBTAIN CEMENT TOP OF 6060 FEET. PERFS AT 6060' AND 6400'.
OPERATOR WAS PUMPING CEMENT WITH HALLIBURTON PUMP TRUCK DURING VISIT, AND
HAD 2000 PSI FOR INJECTION PRESSURE.

STATE OF UTAH
DIVISION OF OIL, GAS AND MINING

APPLICATION FOR PERMIT TO DRILL, DEEPEN, OR PLUG BACK

1. Type of Work: DRILL DEEPEN *Reentry* PLUG BACK

2. Type of Well: Oil Well Gas Well Other SWD Single Zone Multiple Zone

3. Name of Operator: ANR Production Company

4. Address of Operator: P.O. Box 749, Denver, CO 80201-0749 (303) 573-4476

5. Location of Well (Report location clearly and in accordance with any State requirements.):
At surface: 2334' FNL & 1201' FEL (SE/NE)
At proposed prod. zone: Same

6. Lease Description and Serial No.: Patented

7. If Indian, Alutian or Tribe Name: N/A

8. Unit Agreement Name:

9. Farm or Lease Name: Tew

10. Well No.: #1-9B5

11. Field and Pool, or Wildcat: Altamont

12. Sec., T., R., S. or 6th. and Survey or Area: Section 9-T2S-R5W

13. Distance in miles and direction from nearest town or post office: Well located 11 miles WSW of Altamont, UT.

14. Distance from proposed location to nearest property or lease line, ft. (Also to nearest dril. line, if any): 1201' FEL

15. No. of acres in lease: 480

16. No. of acres assigned to this well: 480

17. Distance from proposed location to nearest well, drilling, completed, or spudded for, on this lease, ft.: N/A

18. Proposed depth: 9560'

19. Rotary or cable tools: Rotary

20. Elevation (Show whether DF, RT, GR, etc.): 7047' GL, 7073' KB

21. Approx. date work will start:

PROPOSED CASING AND CEMENTING PROGRAM

Size of Hole	Size of Casing	Weight per Foot	Setting Depth	Quantity of Cement
17 1/2"	13-3/8"	68#	351'	700 sx
12 1/2"	9-5/8"	40#	5841'	1300 sx
8-3/4"	7"	29#	11,999'	400 sx

Propose to re-enter the previously P&A'd Tew #1-9B5 (Operator ANR) and convert to SWD well. The well will be cleaned out to 9560' and the Uinta perf'd @ 3700'-5800' and Upper Green River (TGR1) perf'd @ 5900'-6400'. The well will be converted to injection to allow disposal of Wasatch/Lower Green River produced water from the Altamont/Bluebell Field. The EPA has granted approval for injection on June 3, 1994 (Permit #UT2722-03788).

IN ABOVE SPACE DESCRIBE PROPOSED PROGRAM: If proposal is to deepen or plug back, give data on present productive zone and proposed new productive zone. If proposal is to drill or deepen directionally, give pertinent data on subsurface conditions and measured and true vertical depths. Give blowout preventer program, if any.

I hereby certify that this report is true and complete to the best of my knowledge.

Signed: Marc D. Ernest Title: Production Superintendent Date: 6/14/94

RECOMMENDED PROCEDURE

1. MIRU workover rig. (Note: Give State of Utah 24-hour notice prior to moving in.)
2. Dig out cellar. Weld on 7" 26-29# S-95 landing joint & horse collar to 9 5/8" csg. Install 7" 5000# csg head flange. NU 6" 5000# WP BOP's (7-1/16" bore).

SWD CONVERSION PROCEDURE

TEW #1-9B5

PAGE 2

- 3) RIH w/6" drag bit. Drill out surface plug @ surface to 200'. Pressure test 7" csg above 5500' to 2000#. Drill out cmt plug @ 5500-5940' (440'). RIH & CO 7" csg to PBTD @ 9560'. Pressure test 7" csg to 2000#. If 7" csg leaks, consider Casing Inspection Log and squeeze as needed. POH w/bit.
- 4) Run a GR/CBL log from 9560' to surface w/2000# to determine cmt coverage.
- 5) From the CBL log, perf 7" csg & set a cmt retainer to isolate the proposed Upper Green River perms @ $\pm 5900-6400'$. Squeeze w/necessary cement as required.
- 6) Perf & set a cmt retainer to isolate the proposed Uinta perms @ $\pm 3700-5800'$. Squeeze with necessary cement as required. WOC.
- 7) PU 6" mill & drill out squeezes. Pressure test each to 2000# after drillout. Circulate & condition hole. POH.
- 8) Run a GR/CBL log across proposed zones of interest w/2000#. Re-squeeze as necessary.
- 9) Run a SDT/CNL/GR Digital Sonic log from 8000' to surface to determine proposed injection zones in well. (Note: No open hole logs were run above 5841' due to hole problems.)
- 10) RU wireline w/lubricator. Perforate the proposed Uinta selectively @ $\pm 3700-5800'$ and the Upper Green River (TGR1) @ $\pm 5900-6400'$ @ 4 SPF w/4" csg gun. Correlate to the SDT Sonic log.
- 11) RIH w/Mtn States retrievable pkr & bridge plug on 2 $\frac{7}{8}$ " tbg. Isolate perforated intervals @ 3700-5800' and 5900-6400' and swab test separately for analysis of formation water as required by the State of Utah and BLM.
- 12) Set pkr above all zones @ $\pm 3500'$. Acidize Uinta & Upper Green River zones w/16,000 gal 15% HCl + rock salt & BAF (diverter) in 4 stages.
Note: A) All acid to contain inhibitor, friction reducer, iron sequestering agent and surfactant.
 B) Pump at max possible rate (12-15 BPM), not to exceed 5000 psi.
 C) Hold 2000 psi on csg during job.
- 13) POH w/pkr & RBP.
- 14) PU 3 $\frac{1}{2}$ " "F" nipple (PC), 4' - 3 $\frac{1}{2}$ " pup jt (PC), Mtn States Lok-set pkr (PC) w/on-off tool and 3 $\frac{1}{2}$ " 9.3# J-55 8rd tbg (internal coated w/Duoline-20 fiberglass & Threadmaster MMS couplings, Burst 6980 psi, Collapse 7400 psi, Tension 142,000#, max temp 300°F). Pressure test tbg to 5000 psi. Circ treated, non-corrosive production water for pkr fluid. Set pkr @ $\pm 200'$ above uppermost perf w/18-20,000# tension. Test annulus to 2000 psi.
- 15) Land tbg. ND 80P, NU injection WH. RDMO rig.

SWD CONVERSION PROCEDURE
TEW #1-985
PAGE 3

- 16) Establish step-rate injectivity test into the Uinta & Upper Green River injection intervals to determine maximum allowable injection pressure.
- 17) Hook up injection pump & lines. Install SWD battery.
- 18) Obtain SWD permit.
- 19) Place well on saltwater injection.

* Must be accompanied by a cement verification report.

12. DESCRIBE PROPOSED OR COMPLETED OPERATIONS (Clearly state all pertinent details, and give pertinent dates. If well is directionally drilled, give subsurface locations and measured and true vertical depths for all markers and zones pertinent to this work.)

Re-entered the previously P&A'd Tew #1-9B5 well on 7/19/94 for conversion to SWD. Well was cleaned out to 9683' and the Uinta perf'd @ 4206'-5822' and Upper Green River (TGR1) perf'd @ 5948'-5952'. The well was converted to injection on 10/26/94 to allow for disposal of Wasatch/Lower Green River produced water from the Altamont/Bluebell Field. Conversion is under EPA permit #UT2722-03788. See attached chronological history for details. Operations are presently underway to hookup injection facilities.

RE: Tew #1-9B5 SWD
EPA Injection Permit #UT2722-03788
Altamont Field
Duchesne County, Utah

Gentlemen:

Please find enclosed a **Sundry Notice** for the conversion of the Tew #1-9B5 to saltwater disposal. Operations commenced on July 19, 1994, and were completed on October 26, 1994. Injection facilities are presently being installed and should be in operation within the week. Also attached is a chronological history of the work and other support data submitted to the EPA. Also, there are copies of the data previously faxed to you covering CBL data, water analysis and water flow log.

Please review the data and if you have any questions, let us know (303) 573-4454.

Sincerely,

Marc D. Ernest
Production Superintendent

To: Marc Ernest
From: Garry Williams
Subject: CBL Evaluation - Duncan Tew #1-9B5 Duchesne UT

Comments regarding types of cement bond logs are as follows;

Since the well has more than one pipe string, it is important to realize that the lower frequency CBL is the best choice to look for evidence of formation signal on the VDL trace. The CBL however has difficulty evaluating the presence or absence of a low compressive strength cement. The bond log of choice for light weight (low compressive strength) cements is the ultra sonic Cement Evaluation Tool (CET) or the Ultra Sonic Imaging Tool (USIT). However, due to their higher frequency they do not see beyond the cement sheath behind the first pipe string.

A combination of both CBL & the CET or USIT would allow me to better evaluate cement behind the first string but it is also important to know what the hydraulic isolation is behind the second pipe string.

The objective is to provide hydraulic isolation between zones. To attempt to squeeze several zones without knowing whether isolation presently exists or not can be cost prohibitive.

Since a tool does exist (WFL - Water Flow Log) that measures water flow behind pipe, it may be advisable to consider, as an alternate, to convert the well to injection and monitor for fluid movement at specified time intervals at a later date.

If flow is outside the specified zone, then a squeeze to provide hydraulic isolation could be targeted at the correct depth(s).

Many times in older wells the sloughing of the formation against the pipe over long intervals will provide a hydraulic seal.

Evidence of this is the inability to establish circulation as was apparent several times during the attempted squeeze operations.

Eccentralized casing strings are prone to channeling that is hard to squeeze at the azimuth adjacent to where the strings are touching each other or the open hole wellbore.

Specific comments regarding the existing CBL logs are as follows;

CBL of 7-28-94

9630' to 8720' - Little to no formation signal indicating essentially no hydraulic isolation.

8720' to 7340' - Some evidence of cement due to formation arrivals on the VDL signature. This is indicative of part of the casing circumference having cement and part of the circumference having no cement. Typical for non centralized casings.

7340' to 6335' - Little to no formation signal indicating essentially no hydraulic isolation.

6335' to 6054' - Some evidence of cement due to formation arrivals on the VDL signature. This is indicative of part of the casing circumference having cement and part of the circumference having no cement. Typical for non centralized casings.

6054' to 6046' - Good bond, good hydraulic isolation.

6046' to 6016' - Fair bond, fair hydraulic isolation.

6016' to 5978' - Good bond, good hydraulic isolation.

5978' to 5888' - Partial bonding, suspect eccentered casing.

5888' to 5826' - Good bond, good hydraulic isolation.

5826' to 5810' - Partial bonding, suspect eccentered casing.

5810' to 5724' - Good bond, good hydraulic isolation.

5724' to 5090' - Partial bonding, suspect eccentered casing.

5090' to 0030' - Mostly free pipe, some intervals showing formation signal on the VDL signature indicating low compressive strength cement &/or eccentered casings. Formation signal evident throughout most of the interval.

CBL of 8-5-94

4930' to 2930' - Amplitude indicates some filling of the suspected channeling due to eccentered casing.

2930' to 2300' - Minor changes in amplitude would indicate minor changes of the hydraulic isolation. Low compressive strength cement has minor affect on amplitude response.

2300' to 0024' - No significant change in hydraulic isolation.

CBL of 8-17-94

6550' to 6402' - See evidence of squeeze at 6400'.

6402' to 6396' - See stronger evidence of squeeze at 6400'.

6396' to 6173' - Minor evidence of squeeze.

6173' to 6163' - More significant evidence of squeeze. Improved hydraulic isolation.

6163' to 6132' - Minor evidence of squeeze.

6132' to 5996' - Improved bond/hydraulic isolation from the CBL of 7-28-94.

5996' to 5886' - Minor evidence of squeeze.

5886' to 5798' - Same good bonding/hydraulic isolation as in the CBL of 7-28-94. No apparent change.

5798' to 5724' - Minor loss of bonding from CBL of 7-28-94.

5724' to 5672' - No change from CBL of 7-28-94.

5672' to 5666' - Slight bond improvement at the squeeze perms @ 5620'.

5666' to 5066' - Minimal to no change from CBL of 7-28-94.

5066' to 4936' - Good bond/hydraulic isolation as a result of the squeeze @ 5060'.

4936' to 0400' - Small intervals showing evidence of minor changes in bonding.

Suspect minor channeling due to casing eccentralization. (minor evidence of squeeze @ 2925'. From 2900' to 3400' both 7" & 9 5/8" collars are visible on the VDL trace indicating poor hydraulic isolation across this interval.

0400' to 0026' - 7" appears to be free but VDL trace shows evidence of a formation signal indicating part of the circumference is cemented or is laying against the

formation. At this depth it is my opinion that cement covers a portion of the circumference.

CBL of 8-19-94

0400' to 0390' - Good bond/hydraulic isolation.

0390' to 0022' - Improved bonding/hydraulic isolation between the 7" & 9 5/8" casings.

CBL generated from the SDT waveforms of 8-19-94

Sections of good bond/good hydraulic isolation occurs at the following intervals;

6110' to 5985'

5890' to 5825'

5065' to 5000'

In summary - It is my opinion that it would be more cost effective to convert the well to an injector and approve a plan to monitor for fluid movement behind casing using the Water Flow Log (WFL) which is approved by the EPA for Class II disposal wells.

Any water flow outside of the injection interval could then be isolated via a depth specific squeeze.

Subject: Water Flow Log Evaluation - Duncan Tew #1-9B5 Duchesne UT

Comments regarding the Water Flow Log (WFL) run on the above well on 19 Oct 1994:

Station readings were taken at several levels to evaluate the zone(s) of fluid injection.

WFL stations in the 'down flow' mode were taken at the following minitron depths;

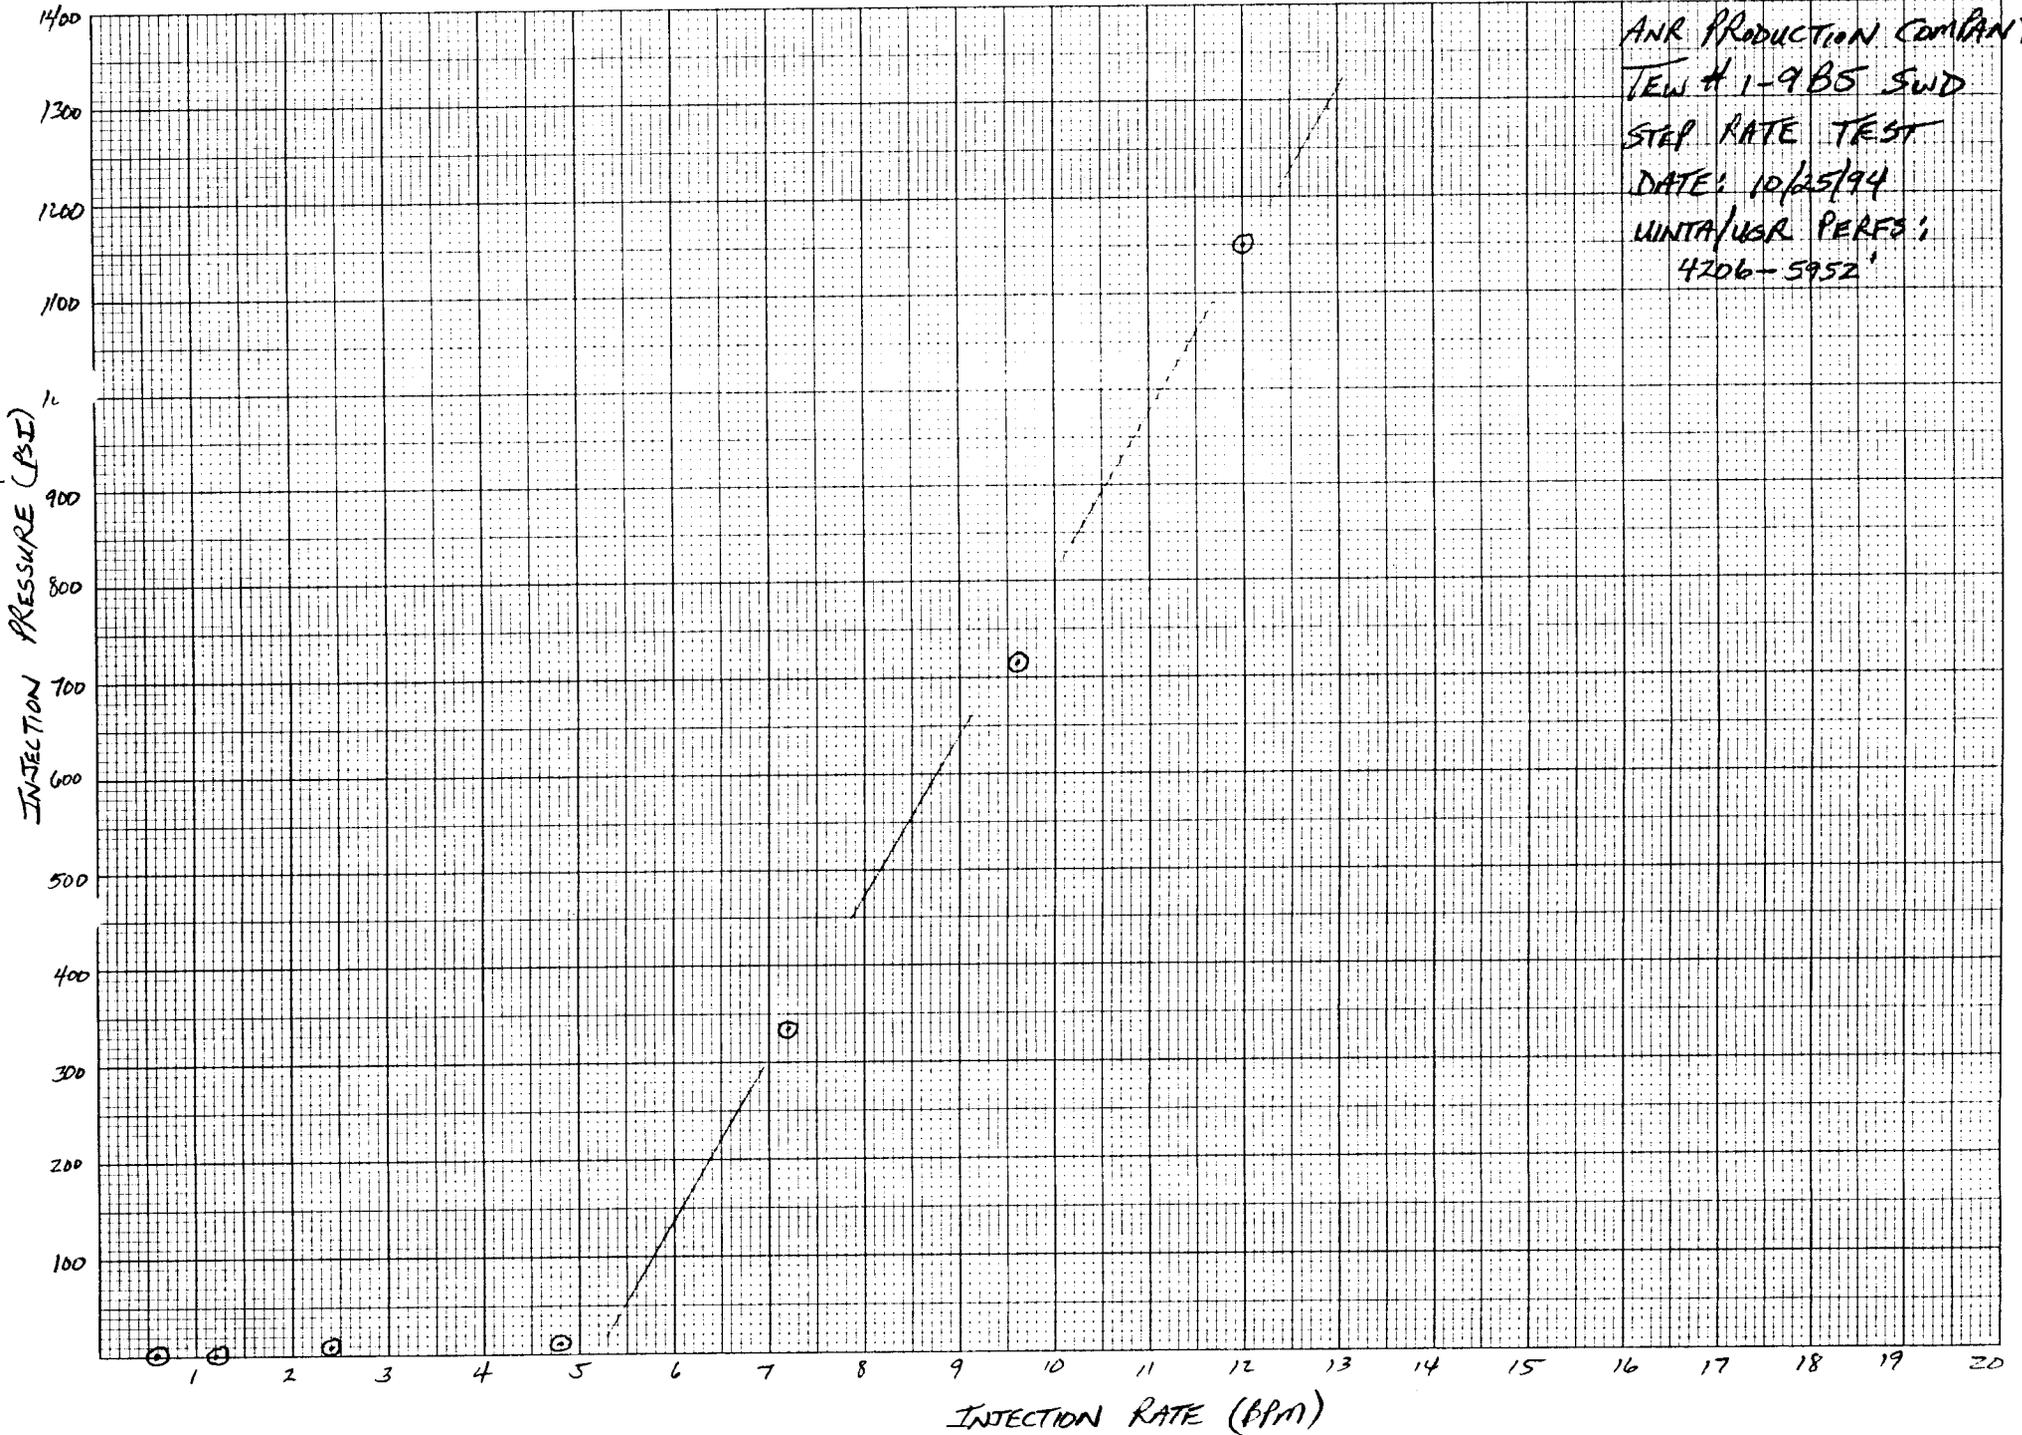

- 1. 4191.8' which was above all perfs showing a down flow velocity of 138.5 feet per minute.**
- 2. 5875.8' which shows a down velocity of 5.1 feet per minute. This indicates that approximately 3.7% of the fluid is available to exit the perfs at 5948' to 5952', 6052' to 6058', 6162' to 6169', 6332' to 6340' & 6346' to 6350'.**
- 3. 6375.8', 6395.8' & 6413.8' which show varying down velocities of 2.5 to 5.4 feet per minute. These varying velocities are interpreted as down flow behind pipe and their velocities vary due to the variable cross sectional area of the flow channel behind the pipe.**

Three stations in the 'up flow' mode were made at 4153.3', 4199.3' & 4206.3'.

These all confirm that there is no up flow behind either string of pipe above the top perforation at 4206'.

To reduce or possibly eliminate the 3.7% of flow exiting below 5875.8', I would recommend that a bridge plug be set at 6025' to take advantage of the best bonded section from 5990' to 6100' as indicated on the Cement Bond Log of 17 August 1994. This would leave the perforations from 5948' to 5952' open to the injection column but would isolate the following perfs from the injection column (6052' to 6058', 6162' to 6169', 6332' to 6340' & 6346' to 6350').

From: Garry Williams
Subject: CBL Evaluation - Duncan Tew #1-9B5 Duchesne UT

Comments regarding types of cement bond logs are as follows;
Since the well has more than one pipe string, it is important to realize that the lower frequency CBL is the best choice to look for evidence of formation signal on the VDL trace. The CBL however has difficulty evaluating the presence or absence of a low compressive strength cement. The bond log of choice for light weight (low compressive strength) cements is the ultra sonic Cement Evaluation Tool (CET) or the Ultra Sonic Imaging Tool (USIT). However, due to their higher frequency they do not see beyond the cement sheath behind the first pipe string.

A combination of both CBL & the CET or USIT would allow me to better evaluate cement behind the first string but it is also important to know what the hydraulic isolation is behind the second pipe string.

The objective is to provide hydraulic isolation between zones. To attempt to squeeze several zones without knowing whether isolation presently exists or not can be cost prohibitive.

Since a tool does exist (WFL - Water Flow Log) that measures water flow behind pipe, it may be advisable to consider, as an alternate, to convert the well to injection and monitor for fluid movement at specified time intervals at a later date.

If flow is outside the specified zone, then a squeeze to provide hydraulic isolation could be targeted at the correct depth(s).

Many times in older wells the sloughing of the formation against the pipe over long intervals will provide a hydraulic seal.

Evidence of this is the inability to establish circulation as was apparent several times during the attempted squeeze operations.

Eccentralized casing strings are prone to channeling that is hard to squeeze at the azimuth adjacent to where the strings are touching each other or the open hole wellbore.

Specific comments regarding the existing CBL logs are as follows;

CBL of 7-28-94

9630' to 8720' - Little to no formation signal indicating essentially no hydraulic isolation.

8720' to 7340' - Some evidence of cement due to formation arrivals on the VDL signature. This is indicative of part of the casing circumference having cement and part of the circumference having no cement. Typical for non centralized casings.

7340' to 6335' - Little to no formation signal indicating essentially no hydraulic isolation.

6335' to 6054' - Some evidence of cement due to formation arrivals on the VDL signature. This is indicative of part of the casing circumference having cement and part of the circumference having no cement. Typical for non centralized casings.

6054' to 6046' - Good bond, good hydraulic isolation.

6046' to 6016' - Fair bond, fair hydraulic isolation.

6016' to 5978' - Good bond, good hydraulic isolation.

5978' to 5888' - Partial bonding, suspect eccentered casing.

5888' to 5826' - Good bond, good hydraulic isolation.

5826' to 5810' - Partial bonding, suspect eccentered casing.

5810' to 5724' - Good bond, good hydraulic isolation.

5724' to 5090' - Partial bonding, suspect eccentered casing.

5090' to 0030' - Mostly free pipe, some intervals showing formation signal on the VDL signature indicating low compressive strength cement &/or eccentered casings. Formation signal evident throughout most of the interval.

CBL of 8-5-94

4930' to 2930' - Amplitude indicates some filling of the suspected channeling due to eccentered casing.

2930' to 2300' - Minor changes in amplitude would indicate minor changes of the hydraulic isolation. Low compressive strength cement has minor affect on amplitude response.

2300' to 0024' - No significant change in hydraulic isolation.

CBL of 8-17-94

6550' to 6402' - See evidence of squeeze at 6400'.

6402' to 6396' - See stronger evidence of squeeze at 6400'.

6396' to 6173' - Minor evidence of squeeze.

6173' to 6163' - More significant evidence of squeeze. Improved hydraulic isolation.

6163' to 6132' - Minor evidence of squeeze.

6132' to 5996' - Improved bond/hydraulic isolation from the CBL of 7-28-94.

5996' to 5886' - Minor evidence of squeeze.

5886' to 5798' - Same good bonding/hydraulic isolation as in the CBL of 7-28-94. No apparent change.

5798' to 5724' - Minor loss of bonding from CBL of 7-28-94.

5724' to 5672' - No change from CBL of 7-28-94.

5672' to 5666' - Slight bond improvement at the squeeze perms @ 5620'.

5666' to 5066' - Minimal to no change from CBL of 7-28-94.

5066' to 4936' - Good bond/hydraulic isolation as a result of the squeeze @ 5060'.

4936' to 0400' - Small intervals showing evidence of minor changes in bonding.

Suspect minor channeling due to casing eccentrallization. (minor evidence of squeeze @ 2925'. From 2900' to 3400' both 7" & 9 5/8" collars are visble on the VDL trace indicating poor hydraulic isolation across this interval.

0400' to 0026' - 7" appears to be free but VDL trace shows evidence of a formation signal indicating part of the circumference is cemented or is laying against the

formation. At this depth it is my opinion that cement covers a portion of the circumference.

CBL of 8-19-94

0400' to 0390' - Good bond/hydraulic isolation.

0390' to 0022' - Improved bonding/hydraulic isolation between the 7" & 9 5/8" casings.

CBL generated from the SDT waveforms of 8-19-94

Sections of good bond/good hydraulic isolation occurs at the following intervals;

6110' to 5985'

5890' to 5825'

5065' to 5000'

In summary - It is my opinion that it would be more cost effective to convert the well to an injector and approve a plan to monitor for fluid movement behind casing using the Water Flow Log (WFL) which is approved by the EPA for Class II disposal wells.

Any water flow outside of the injection interval could then be isolated via a depth specific squeeze.

Duchesne County, Utah

Dear Mr. Ernest:

Thank you for your January 10, 1995, Well Completion Report (Form 7520-10), the witnessed/passed Mechanical Integrity Test (MIT) and pressure recording chart, completed Well Rework Record (Form 7520-12), injection water analyses (1.030 Sg), and the injection formation static bottom hole pressure of 2,525 psig at 5,952' for the above-cited, recently permitted injection facility.

You are hereby authorized to commence injection into only the 4,206-5,822' Uinta and the 5,948-5,952' Upper Green River perforated intervals now that these documents have been reviewed and approved, and that all "prior to injection" permit conditions have been satisfied.

Please direct any written questions you have on this action to the attention of Gustav Stolz at Mail Code 8WM-DW; you may telephone him at (303) 293-1416.

Sincerely,

Thomas J. Pike
Chief
UIC Implementation Section

* Must be accompanied by a cement verification report.

12. DESCRIBE PROPOSED OR COMPLETED OPERATIONS (Clearly state all pertinent details, and give pertinent dates. If well is directionally drilled, give subsurface locations and measured and true vertical depths for all markers and zones pertinent to this work.)

This sundry notice is being submitted to correct the Operator name on an EPA-approved Injection Permit #UT2722-03788 for the subject SWD well. The injection permit was inadvertently filed under Coastal Oil & Gas Corporation. It should have been filed under ANR Production Company, as Operator. Both companies are sister companies under the same parent company, The Coastal Corporation. Since our SWD system for the field is operated under ANR Production Company, we wish to operate this well under the same operator name. Please make the appropriate changes to denote this change.

Date of work completion _____

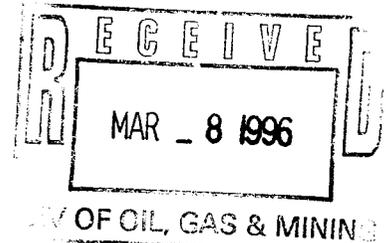

Report results of **Multiple Completions** and **Recompletions** to different reservoirs on WELL COMPLETION OR RECOMPLETION REPORT AND LOG form.

* Must be accompanied by a cement verification report.

12. DESCRIBE PROPOSED OR COMPLETED OPERATIONS (Clearly state all pertinent details, and give pertinent dates. If well is directionally drilled, give subsurface locations and measured and true vertical depths for all markers and zones pertinent to this work.)

Please be advised that effective December 27, 1995, ANR Production Company relinquished and Coastal Oil & Gas Corporation assumed operations for the subject wells (see attached). Bond coverage pursuant to 43 CFR 3104 for lease activities is being provided by Coastal Oil & Gas Corporation under the following bonds: State of Utah #102103, BLM Nationwide Bond #U605382-9, and BIA Nationwide Bond #11-40-66A. Coastal Oil & Gas Corporation, as operator, agrees to be responsible under the terms and conditions of the leases for the operations conducted upon leased lands.

OPERATOR CHANGE DOCUMENTATION

- Sec* 1. (Rule R615-8-10) Sundry or other legal documentation has been received from former operator (Attach to this form). *(Rec'd 3-8-96)*
- Sec* 2. (Rule R615-8-10) Sundry or other legal documentation has been received from new operator (Attach to this form). *(Rec'd 3-8-96)*
- N/A* 3. The Department of Commerce has been contacted if the new operator above is not currently operating any wells in Utah. Is company registered with the state? (yes/no) _____ If yes, show company file number: _____.
- N/A* 4. (For Indian and Federal Wells ONLY) The BLM has been contacted regarding this change (attach Telephone Documentation Form to this report). Make note of BLM status in comments section of this form. Management review of **Federal and Indian** well operator changes should take place prior to completion of steps 5 through 9 below.
- Sec* 5. Changes have been entered in the Oil and Gas Information System (Wang/IBM) for each well listed above. *(3-11-96) (4-3-96/Indian) (4-15-96/Fee C.A.'s) (8-20-96/Indian C.A.'s)*
- Sec* 6. Cardex file has been updated for each well listed above.
- Sec* 7. Well file labels have been updated for each well listed above.
- Sec* 8. Changes have been included on the monthly "Operator, Address, and Account Changes" memo for distribution to State Lands and the Tax Commission. *(3-11-96)*
- Sec* 9. A folder has been set up for the Operator Change file, and a copy of this page has been placed there for reference during routing and processing of the original documents.

ENTITY REVIEW

- 1. (Rule R615-8-7) Entity assignments have been reviewed for all wells listed above. Were entity changes made? (yes/no) no (If entity assignments were changed, attach copies of Form 6, Entity Action Form).
- 2. State Lands and the Tax Commission have been notified through normal procedures of entity changes.

BOND VERIFICATION (Fee wells only) Surety No. U605382-1 (\$80,000) United Pacific Ins. Co.

- 1. (Rule R615-3-1) The new operator of any fee lease well listed above has furnished a proper bond.
- 2. A copy of this form has been placed in the new and former operators' bond files. ** Upon Compl. of routing.*
- 3. The former operator has requested a release of liability from their bond (yes/no) no. Today's date March 11, 1996. If yes, division response was made by letter dated _____ 19____. *(Same Bond as Coastal)*

LEASE INTEREST OWNER NOTIFICATION RESPONSIBILITY

- 1. (Rule R615-2-10) The former operator/lessee of any fee lease well listed above has been notified by letter dated _____ 19____, of their responsibility to notify any person with an interest in such lease of the change of operator. Documentation of such notification has been requested.
- 2. Copies of documents have been sent to State Lands for changes involving State leases.

FILMING

- 1. All attachments to this form have been microfilmed. Date: 1-7 1997.

FILING

- 1. Copies of all attachments to this form have been filed in each well file.
- 2. The original of this form and the original attachments have been filed in the Operator Change file.

COMMENTS

Attention Dan Jackson & Dan Jarvis:

Please find attached the MIT Annulus Pressure Monitoring results for the above referenced well.

Coastal Oil & Gas Corporation believes that the wells are performing normally and require no further work to remain functionally sound and Coastal intends to continue current injection activity.

Please review the attached monitoring results and provide us with your comments ASAP. If you have any questions, please do not hesitate to call me @ (435)-781-7023.

Sincerely,

Cheryl Cameron
Environmental Analyst

Dear Mr. Jafari:

Per conditions described in the permit identified above, please find results for the mechanical integrity test (MIT) recently performed on the above referenced well. As data enclosed indicates, this well attained a "pass" performance for the MIT.

If you have questions, you may contact me at (435)781-7048.

Sincerely,

Deborah A. Harris, PG

**CERTIFICATE OF AMENDMENT
OF
CERTIFICATE OF INCORPORATION**

COASTAL OIL & GAS CORPORATION (the "Company"), a corporation organized and existing under and by virtue of the General Corporation Law of the State of Delaware, DOES HEREBY CERTIFY:

FIRST: That the Board of Directors of the Company, by the unanimous written consent of its members, filed with the minutes of the Board, adopted a resolution proposing and declaring advisable the following amendment to the Certificate of Incorporation of the Company:

RESOLVED that it is deemed advisable that the Certificate of Incorporation of this Company be amended, and that said Certificate of Incorporation be so amended, by changing the Article thereof numbered "FIRST." so that, as amended, said Article shall be and read as follows:

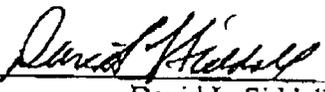

"FIRST. The name of the corporation is El Paso Production Oil & Gas Company."

SECOND: That in lieu of a meeting and vote of stockholders, the stockholders entitled to vote have given unanimous written consent to said amendment in accordance with the provisions of Section 228 of the General Corporation Law of the State of Delaware.

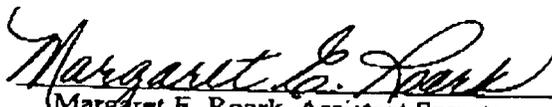

THIRD: That the aforesaid amendment was duly adopted in accordance with the applicable provisions of Sections 242 and 228 of the General Corporation Law of the State of Delaware.

IN WITNESS WHEREOF, said COASTAL OIL & GAS CORPORATION has caused this certificate to be signed on its behalf by a Vice President and attested by an Assistant Secretary, this 9th day of March 2001.
