Mr. Cleon B. Feight

Dear Mr. Feight:

We are enclosing our Application for a Permit to Drill the above referenced well. As stated in the cover letter to Mr. E. W. Guynn, we realize that this well has to be classed as an exception to the spacing rules and can not be completed within the same zones found in the offsetting well 100 feet to the west. Should the well have no evidence of hydrocarbons below these zones, it will be plugged and abandoned.

Should you have any questions or need additional information, please contact us.

We propose to rig up and drill a 12 1/2" hole to approximately 150 feet and set 9-5/8" - 36# new K-55 Range 2 (30 foot joints) surface casing. After nipping up, the surface casing and BOP's will be pressure tested to 500 psi. The shoe will be drilled out and an 8-3/4" hole will be drilled to about 2600 feet using air as the circulating medium. A 7" - 20# new K-55 Range 2 intermediate casing string will be run and cemented. After nipping up, the casing and BOP's will be pressure tested to 500 psi. The shoe will be drilled out and a 6 1/2" hole will be drilled to about 3200 feet using air as the drilling medium. Should the well be productive, a 4 1/2" - 10.5# new K-55 Range 3 liner will be run and cemented. It will then be perforated, tested, and stimulated if necessary. If the well is non-productive, permission will be secured and the well plugged and abandoned. Potentially productive intervals are the Cedar Mountain, Morrison and Entrada formations.

IN ABOVE SPACE DESCRIBE PROPOSED PROGRAM: If proposal is to deepen or plug back, give data on present productive zone and proposed new productive zone. If proposal is to drill or deepen directionally, give pertinent data on subsurface locations and measured and true vertical depths. Give blowout preventer program, if any.

Re: United Energy Corporation
Federal Well #14-1
NW NW Sec. 14, T20S, R21E
Grand County, Utah

Mr. E. W. Gynn, District Engineer
United States Geological Survey
8440 Federal Building
Salt Lake City, Utah 84138

Dear Mr. Gynn:

We are enclosing our Application for a Permit to Drill the above referenced well together with its Multi-Point Surface Use and Operations Plan. This particular well is located approximately 100 feet east of Federal #14-1.

During the drilling operations of #14-1, we encountered a substantial flow of natural gas. We were able to kill the well with water base drilling mud, but lost circulation problems caused us to forego deepening this well to the desired depth. Production casing has been run and cemented across the gas bearing zone.

It is our intention to drill a second well as proposed to the depth desired which is approximately 100 feet into the Entrada formation. Our drilling program has been designed so that an intermediate string can be run and cemented should we encounter the same lost circulation zone found in the previous well. We anticipate additional surface disturbance for the location of no more than 60 feet to the east of the present location. Is it possible for our permit to be expedited since it probably can be done under the original EIA?

We realize that this well is an exception to the spacing rules and should it be productive, the well will not be produced from the same zones as the offsetting well.

Should you need additional information or have any questions, please contact me at (303) 245-1958 or my residence 243-9599.

Very truly yours,

John I. Gordon

GEOLOGIC REPORT
ON
N. P. ENERGY FED. #14-1A WELL
DECEMBER 26, 1979

1. The N. P. Energy #14-1A well was drilled an offset (150') to the #14-1 well since the latter well was drilled only to a depth of 2556', which was near the top of the Morrison formation, and did not satisfy the commitment required by the farmout agreement with Allied Chemical Corp. (now Union Texas Petroleum). The #14-1 well obtained a large flow of gas in the Dakota and Cedar Mountain formations and drilling was ceased at a depth of 2556' because of the large volume of gas and was mudded-up at that depth and completed; rather than subject the zone to possible damage by further drilling. Thus, the Fed. #14-1A well had to be drilled into the Entrada formation to earn the acreage.
2. Because of the close proximity to the #14-1 well, the subject well could not be completed in the same sand reservoirs; so only the Morrison sands could be considered for completion. However, in spite of the close position of the well to the #14-1 well (150'), there was considerable difference in the sand bodies encountered in each well. The #14-1A well had two additional sand lenses in the Dakota formation, which were not present in the #14-1 well, and there was much less overall sand in the Cedar Mountain formation in the subject well than in the #14-1 well. Similarly, there was a much smaller flow of gas in the second well.
3. The subject well was drilled in April, 1978; but was not completed until in May, 1979, over one year later. The well was drilled to a total depth of 3230 feet, which was about 100' below the top of the Entrada formation. Casing (4½") was set at 2906' and cemented. The cement bond log on this well indicated a very poor cement bond and thus limited the amount of completion work that could feasibly be accomplished.
4. The electric logs on the well indicated six different sands in the Morrison formation. Four of these sands appeared to have possibilities for gas production according to the logs; and

calculations based on the log data indicated porosities of 12% and water saturations of 51% to 65%. These four sands: 2560' to 2568'; 2780' to 2792'; 2820' to 2834'; and 2838' to 2854' were perforated and completed for natural gas production. The initial production rate was quite small, 200 MCF/D on a 3/8" choke with 45# tubing pressure, and was accompanied by about 1 gal/min. of salt water. It is anticipated that some additional work may be required on this well to improve the production rate. It is expected that a cement squeeze to isolate some of the sands may be required and some stimulation work accomplished.

5. The two other sands in the Morrison, which were not perforated: 2640' to 2658' and 2666' to 2692', have some potential according to the electric logs; but calculations indicate a 60% and 70% water saturation respectively. It was felt that the lower sand might contain water and because of only 6 ft. of cement bond between the sands, the risk of communication was too great to complete the upper sand initially. This sand, 2640' to 2658', can be completed at a later date after the other sands have been depleted.
6. The formations with their tops, thicknesses, and datum points, which were encountered in the subject well as determined from the electric logs are as follows:

<u>Formation</u>	<u>Depth to Top</u>	<u>Thickness</u>	<u>Datum</u>
Mancos	Surface	2352'	5379' K.B.
Dakota *	2352'	83'	3027'
Cedar Mountain *	2435'	83'	2944'
Morrison (Brushy Basin)*	2518'	262'	2861'
(Salt Wash)*	2780'	250'	2599'
Curtis-Summerville	3030'	90'	2349'
Entrada	3120'	—	2259'
Total Depth	3230'		

*Formations with hydrocarbon shows.

7. It is concluded that the subject well was a significant test. Whereas, the initial production rate is small, 200 MCF of gas per day, it is felt that the sand development in the Morrison was excellent and that the low production rate is not really representative of the full potential of the sands. It is

anticipated that the mechanical conditions associated with the drilling of the well and the poor cement bond may be responsible for the low production rate. It is quite possible that the rate will increase as the well is produced; but additional work may be required to improve the production rate as noted above. The shut-in pressure of the well is quite high, 870#, indicating that there could be sizeable reserves present in the reservoir sands. Normally, this pressure would indicate reserves of natural gas amounting to approximately 500,000 MCF from this well.

7. It is concluded that the subject well was a significant test. Whereas, the initial production rate is small, 200 MCF of gas per day, it is felt that the sand development in the Morrison was excellent and that the low production rate is not really representative of the full potential of the sands. It is

anticipated that the mechanical conditions associated with the drilling of the well and the poor cement bond may be responsible for the low production rate. It is quite possible that the rate will increase as the well is produced; but additional work may be required to improve the production rate as noted above. The shut-in pressure of the well is quite high, 870#, indicating that there could be sizeable reserves present in the reservoir sands. Normally, this pressure would indicate reserves of natural gas amounting to approximately 500,000 MCF from this well.

These zones will be re-perforated to 4 SPF with 3-3/8" casing guns.

Stimulation treatments will be performed as recommended by the stimulation companies. Acid and methanol will be used in most all cases. If these zones are non-productive, the Dakota Formation will be perforated and stimulated at the following intervals: 2358-2370, 2410-18, 2488-2500, 4 SPF.

Well will then be tested for commercial production evaluation. If well is non-commercial - Moab, Utah District Office will be contacted for well abandonment procedures.

Hi Kimball,

We will be able to move forward with moving the statewide blanket bond from Rose to individual bonds with Rockies. Below is the break down of what Dustin is going to require for each well.

CPSKY PHLPS FEE 8-1 \$15,000

Thunderbird 1 \$1,500

State 32-1 \$15,000.00

State 16-42 \$30,000

State 1-34 \$30,000.00-Once you have final inspection on this well you can submit a letter requesting a bond release on the funds.

Bring a total of \$91,500.00. What I need from Rockies now is a Form 4B.2 on each well. The bond number is going to be the check number (1001696885), then if you could add an alpha character to the end (e.g 1001696885a, 1001696885b) this help to keep the records clear in our system.

Rockies currently has two cash bonds with the Division, but as a precaution if you could also submit a current IRS W-9 form for the bank that holds our bonds that would be greatly appreciated.

Also, to have a clear account, if you would submit a letter with the above forms stating that you're using the blanket bond as individual bond. Follow that up with a request to release the remaining \$28,500 that per the submitted agreement needs to be sent to Rockies Standard and the address we should mail the check to.

To answer Brad's question the two years audited financials would need to be reviewed by an independent certified public accountant.

If you have any question please let me know. In regards to this matter...because I am handling multiple task that take me away from my desk recently, if you try to call or email me and I'm not available you may call my cell phone [REDACTED]

Thanks!

RE: Moving Rose Blanket Bond to Rockies Individual Bonds 1001696885a, 1001696885b, 1001696885c, 1001696885d, and 1001696885e and Releasing Balance to Rockies

Enclosed is a completed Form 4B.2 for each of five wells recently acquired from Rose Petroleum (Utah), LLC (“Rose”) for which Rockies Standard Oil Company, LLC (“RSOC”) will assume operations. Rose assigned its blanket DOGM bond (1001696855) to Rockies, but Rockies requests that Rose’s statewide bond instead be used to bond these wells on an individual basis rather than blanket.

Rockies further requests that the balance of the Rose blanket bond (such balance in the amount of \$28,500.00) be released to Rockies at:

Rockies Standard Oil Company, LLC
Attn: Operations
1411 East 840 North
Orem, UT 84097

Your help and prompt attention to this matter is greatly appreciated.
