STANDARD STIPULATIONS FOR OIL & GAS EXPLORATION

Contact this office at least 48 hours prior to beginning construction of access road and pad.

Stockpile the surface 12 inches of topsoil in a wind-row on the north west quadrant of the location.

The upper banks (uphill side) of all cuts will be rounded during construction of the access road and pad.

Notify the BLM District Archaeologist if cultural material from sub-surface deposits is exposed during the operation.

The trash cage will be at the location and fenced with fine mesh wire during drilling operations.

The "blooey" line will be centered and directed into the pit.

If production is obtained, the access road will be upgraded to BLM specifications for long-term roads as outlined in the surface use standards section of the "Oil and Gas" pamphlet (joint BLM, USGS and USFS publication).

If production is obtained, all production facilities will be painted. (See enclosed suggested colors - for facilities).

Rehabilitation of the site and access road will be accomplished in accordance with the enclosed restoration procedures.

Production facilities and pipeline route are approved on this location under lease rights.

As agreed upon at the pre-drill field examination -

Access -

- 1) Approximately 0.2 miles of new road will be constructed in NW/NE Sec. 13, from an existing road south easterly to the well pad.
- 2) Surface disturbance will be kept to a minimum, until production is determined. Vegetation and soils removed from the road will be windrowed along the north side of the road.
- 3) Low water crossing will be installed in Strychnine wash, and any other drainage the road crosses. Crossing a dry wash on a north-south angle, then Strychnine at the same angle.

Location -

- 1) Well pad size will be 150 feet wide x 250 feet long for maximum disturbed surface.
- 2) Well will be moved 70 feet north and 30 feet west to satisfy Utah State spacing requirements.

- 3) Pit(s) dikes along the edge of and off from the pad will be 1.5 - 2.0 feet above the level of the pad. Pit(s) will be constructed in 8 inch soil lifts, machinery compacted, and wide enough for machinery to pass over the dike.
- 4) Pit(s) will be fenced with 48 inch high woven wire on the three sides prior to drilling, and on the 4th side prior to rig removal. Two strands of barbed wire will be used along the top for support.
- 5) An area 1.0 - 1.5 cat blades wide will be cleared to mineral soil behind the pit(s) for fire protection.
- 6) Pit(s) will be 100 feet long x 20 feet wide x 8 feet deep.
- 7) No new construction will be allowed in this area between November 1 and March 31 of any year, unless approved by the Grand Resource Area Manager.
- 8) Surface restoration will be completed within 60 days after well completion. Seeding will be by drilling the seed and during the fall of 1981. Any disturbed area will be ripped and/or disced prior to seeding. Access road and pad will be closed to all vehicular travel if the well is a non-producer.
- 9) If the well produces any oil and storage tanks are placed on the location, the loading valve and oil sump will be kept inside the four foot high berm around the tanks.

RECLAMATION PROCEDURES IN GRAND RESOURCE AREA

1. Disk or rip pads and access roads.
 - a. Overlap passes in order to insure complete treatment.
2. Contour pads and access roads.
 - a. Lay berms into centers.
 - b. Use cut material for fill areas.
 - c. Lay stockpiled surface soil over top of pads and spread evenly.
 - d. On highly erosive soils, it may be more beneficial to grade slopes to reduce steepness.
 - e. Do not smooth pads out, leave a roughened surface. On steeper slopes and slopes with clayey soils scarify or serrate the ground in order to increase water infiltration and reduce erosion.
3. Water bar roads where required by this office.

* 2 percent	Grade	-	200 ft. intervals
2-4 percent	Grade	-	100 ft. intervals
4-5 percent	Grade	-	75 ft. intervals
5 percent	Grade	-	50 ft. intervals

* Actual spacing may vary according to soil stability. Lighter textured soils will require more frequent water bars. When natural drainage ways are present, water bars are to be constructed to make maximum use of them. Plan operations so that natural drainage ways do not become blocked.
4. Seed roads and pads in the fall (Oct. through mid-Dec.).

<p>Well was plugged for abandonment by Well Pluggers, Inc. as follows: A CICR was set at 2756' KB. The 4-1/2" production casing was filled with 9 ppg gelled water and pressure tested. A 15-sack cement plug was pumped with 5 sacks displaced below the CICR at 2756' and 10 sacks dumped on top of the CICR. The 4-1/2" casing was perforated at 267' and 75-sack cement slurry was circulated and filled 4-1/2" production casing and 8-5/8" surface casing from 267' to surface. All casing was cut 3' below ground level and a plate marked with well information was welded to the 8-5/8" casing. The rig anchors and all junk were removed from location.</p>		<p>Accepted by the Utah Division of Oil, Gas and Mining FOR RECORD ONLY</p> <p>April 24, 2014</p>
